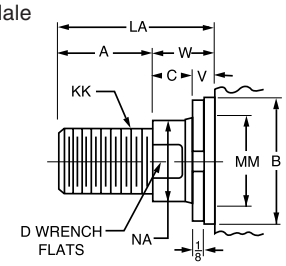
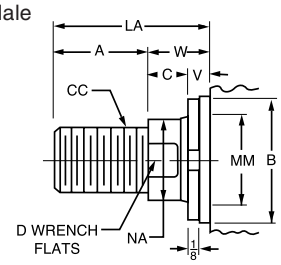
Rod End Dimensions — see table 2

Thread Style 4
(NFPA Style SM)
Small Male



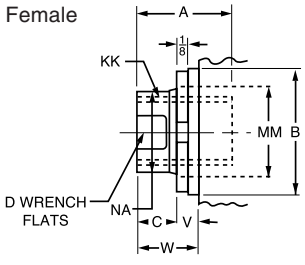
A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through 1⅜" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder.

Thread Style 8
(NFPA Style IM)
Intermediate Male



When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

Thread Style 9
(NFPA Style SF)
Small Female



"Special" Thread Style 3
Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensioned sketch.

For additional information – call your local Parker Cylinder Distributor.

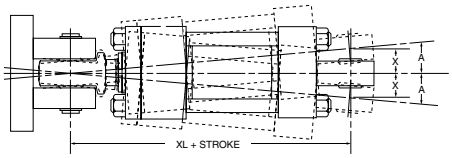
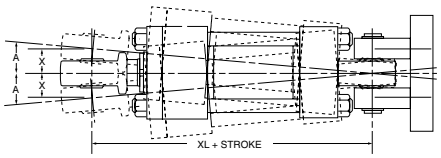
†Maximum operating pressure at 4:1 design factor is based on tensile strength of material. Pressure ratings are based on standard commercial bearing ratings.
Note: for additional dimensions see Series 2H Style BB mount.
Rod No. 1 is standard.
*Dimension "CD" is hole diameter.

Mounting Information

Head End Mounting



Cap End Mounting



Recommended maximum swivel angle on each side of the cylinder centerline.

Table 1

Bore	Head End Mounted Angle a	Head End Mounted Tan. of a	Cap End Mounted Angle a	Cap End Mounted Tan. of a
1½	2°	.035	2°	.035
2	2½°	.044	4½°	.079
2½	2½°	.044	4½°	.079
3¼	3°	.052	3°	.052
4	2½°	.044	3°	.052
5	3°	.052	3°	.052
6	3°	.052	3°	.052

Note: Dimension X is the maximum off center mounting of the cylinder. To determine dimension X for various stroke lengths multiply the distance between pivot pin holes by tangent of angle a. For extended position use X = XL times 2X stroke.

For additional information – call your local Parker Cylinder Distributor.

Parker offers a complete range of Cylinder Accessories to assure you of the greatest versatility in present or future cylinder applications. Accessories offered for the respective cylinder include the Rod Eye, Pivot Pin and Clevis Bracket. To select the proper part number for any desired accessory refer to the charts below.

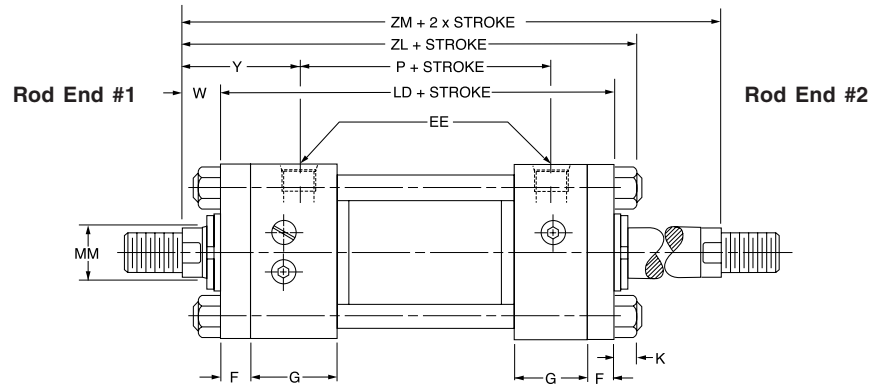
*If only one end of these Double Rod Cylinders is to be cushioned, be sure to specify clearly which end this will be.

‡Specify XI dimension from rod end #1.

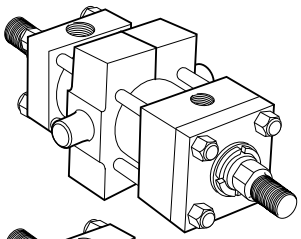
How to Use Double Rod Cylinder Dimensioned Drawings

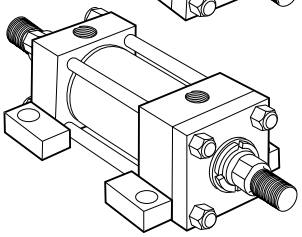
1½" to 6" Bores

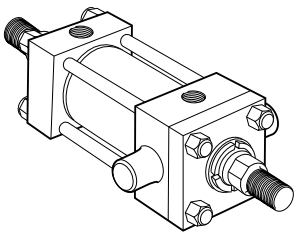


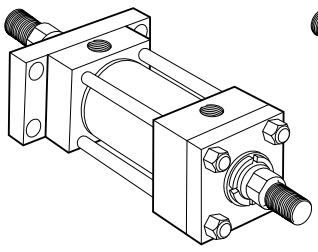
To determine dimensions for a double rod cylinder, first refer to the desired single rod mounting style cylinder shown on preceding pages of this catalog. (See table at left.) After selecting necessary dimensions from that drawing, return to this page supplement the single rod dimensions with those shown on drawing at right and dimension table below. Note that double rod cylinders have a head (Dim. G) at both ends and that dimension LD replaces LB and ZL replaces ZB, etc. The double rod dimensions differ from, or are in addition to those for single rod cylinders shown on preceding pages and provide the information needed to completely dimension a double rod cylinder.

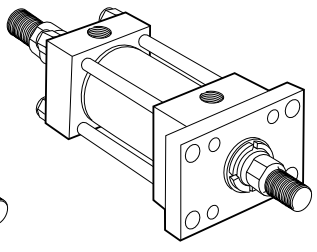
On a double rod cylinder where the two rod ends are different, be sure to clearly state which rod end is to be assembled at which end. Port position 1 is standard. If other than standard, specify pos. 2, 3 or 4 when viewed from rod end #1 only. See port position information in Section C.











All dimensions are in inches and apply to Code 1 rod sizes only. For alternate rod sizes, determine all envelope dimensions (within LD dim.) as described above and then use appropriate rod end dimensions for proper rod size from single rod cylinder.

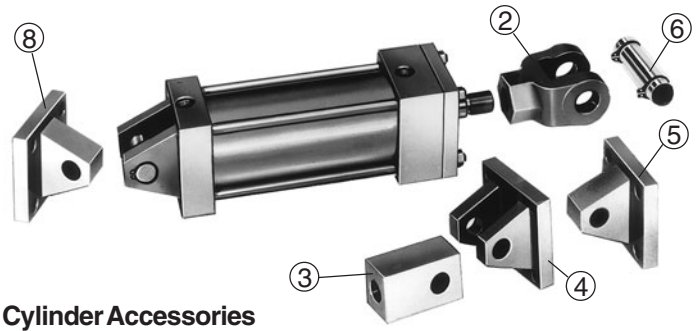
NOTES

Series 2H
Heavy Duty Hydraulic Cylinders



Cylinder Accessories

Parker offers a complete range of cylinder accessories to assure you of greatest versatility in present or future cylinder applications.

Rod End Accessories

Accessories offered for the rod end of the cylinder include Rod Clevis, Eye Bracket, Knuckle, Clevis Bracket and Pivot Pin. To select the proper part number for any desired accessory, refer to Chart A below and look opposite the thread size of the rod end as indicated in the first column. The Pivot Pins, Eye Brackets and Clevis Brackets are listed opposite the thread size which their mating Knuckles or Clevises fit.

Chart A

For alignment coupler dimensions, see section C.

*Cylinder accessory dimensions conform to NFPA recommended standard NFPA/T3.6.8 R1-1984, NFPA recommended standard fluid power systems — cylinder — dimensions for accessories for cataloged square head industrial types. Parker adopted this standard in April, 1985. Eye Brackets or Mounting Plates shipped before this date may have different dimensions and will not necessarily interchange with the NFPA standard. For dimensional information on older style Eye Brackets or Mounting Plates consult Drawing #144805 or previous issues of this catalog.

Accessory Load Capacity

The various accessories on this and the following pages have been load rated for your convenience. The load capacity in lbs., shown on the following page is the recommended maximum load for that accessory based on a 4:1 design factor in tension. (Pivot Pin is rated in shear.) Before specifying, compare the actual load or the tension (pull) force at maximum operating pressure of the cylinder with the load capacity of the accessory you plan to use. If load or pull force of cylinder exceeds load capacity of accessory, consult factory.

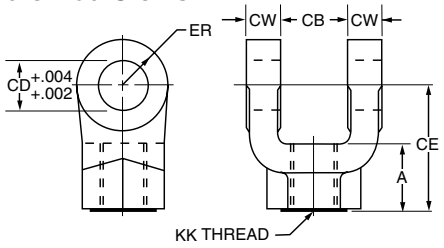
Mounting Plates

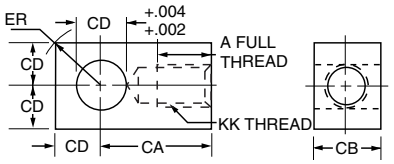
Mounting Plates for Style BB (clevis mounted) cylinders are offered. To select proper part number for your application, refer to Chart B, above right.

② Female Rod Clevis



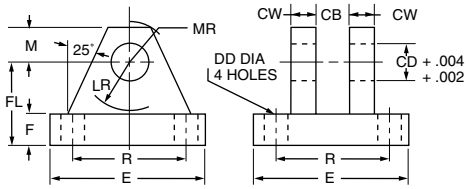
Order to fit thread size.

③ Knuckle (Female Rod Eye)



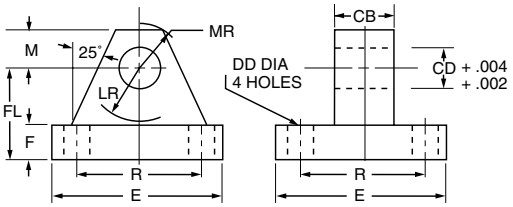
Order to fit thread size.

④ Clevis Bracket for Knuckle



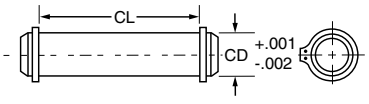
Order to fit Knuckle.

⑧ Mounting Plate or ⑤ Eye Bracket



1. When used to mate with the Rod Clevis, select from Chart A.
2. When used to mount the Style BB cylinders, select from the Mounting Plate Selection Table. See Chart B at lower left.

⑥ Pivot Pin



1. Pivot Pins are furnished with Clevis Mounted Cylinders as standard.
2. Pivot Pins are furnished with (2) Retainer Rings.
3. Pivot Pins must be ordered as separate item if to be used with Knuckles, Rod Clevises, or Clevis Brackets.

For additional information – call your local Parker Cylinder Distributor.

*Cylinder accessory dimensions conform to NFPA recommended standard NFPA/T3.6.8 R1-1984, NFPA recommended standard fluid power systems — cylinder — dimensions for accessories for cataloged square head industrial types. Parker adopted this standard in April, 1985. Eye Brackets or Mounting Plates shipped before this date may have different dimensions and will not necessarily interchange with the NFPA standard. For dimensional information on older style Eye Brackets or Mounting Plates consult Drawing #144805 or previous issues of this catalog.

⊖ See Accessory Load Capacity note on previous page.

•These sizes supplied with cotter pins.

†Includes Pivot Pin.

Consult appropriate cylinder rod end dimensions for compatibility.

For Cylinder Division Plant Locations – See Page II.

How to Order Series "2H" Cylinders

When ordering Series 2H cylinders, please review the following:

Note: Duplicate cylinders can be ordered by giving the SERIAL NUMBER from the nameplate of the original cylinder. Factory records supply a quick positive identification.

Piston Rods: Specify rod code number based on diameter. Give thread style number for a standard thread or specify dimensions. See "Style 3 Rod End" below.

Cushions: If cushions are required specify according to the model number on the next page. If the cylinder is to have a double rod and only one cushion is required, be sure to specify clearly which end of the cylnder is to be cushioned.

Special Modifications: Additional information is required on orders for cylinders with special modifications. This is best handled with descriptive notes. For further information, consult factory.

Additional Lipseal® Piston (if desired): Parker Lipseal® pistons are offered as an option at no extra cost in the Series 2H cylinders. With this feature, zero leakage under static holding conditions is attained. Call out "with Lipseal piston" if this type of piston is desired. If not specified, the ring type piston will be furnished. Hi Load piston seals are available for an additional charge. Refer to the beginning of Section C for the benefits of this piston seal assembly.

Fluid Medium: Series 2H hydraulic cylinders are equipped with seals for use with hydraulic oil. If other than hydraulic oil will be used, specify class of fluid (See Catalog section C.)

Water Service Modifications

Standard – When requested, Parker can supply Series 2H cylinders with standard modifications that make the cylinders more nearly suitable for use with water as the fluid medium. The modifications include chrome-plated cylinder bore; electroless nickel-plated, non-wearing internal surfaces; Lipseal style piston, Buna N Seals and chrome-plated, stainless steel piston rod. On orders for water service cyinders, be sure to specify the maximum operating pressure.

(These factors must be taken into account because of the lower tensile strength of stainless steels available for use in piston rods.)

Warranty– Parker will warrant Series 2H cylinders modified for water service to be free of defects in materials or workmanship. On the other hand, Parker cannot accept responsibility for premature failure of cylinder function, where failure is caused by corrosion, electrolysis or mineral deposits within the cylinder.

Class 1 Seals

Class 1 seals are the seals provided as standard in a cylinder assembly unless otherwise specified. For further information on fluid compatibility or operating limitations of all components, see section C.

For the 2H series cylinders the following make-up Class 1 Seals:
Primary Piston Rod Seal – Enhanced Polyurethane
Piston Rod Wiper – Nitrile
Piston Seals – Cast Iron Rings
Option – Nitrile lipseals with polymyte back-up washers
Option – Hi-Load. Filled P.T.F.E. seals with a nitrile expander
O-Rings – Nitrile (nitrile back-up washer when used)

Combination Mountings

Single Rod End The first mounting is the one called out on the head end of the cylinder. The second or subsequent mountings are called out as they appear in the assembly moving away from the rod end. Exception: When tie rod mountings are part of a combination, the model number should contain an "S" (Special) in the model code and a note in the body of the order clarifying the mounting arrangement. The "P" is used to define a thrust key and is not considered to be a mounting. However, it is located at the primary end.

Example: 4.00 CCBB2HLTS14AC x 10.000

Combination "C" mounting head only. "BB" mounting cap end
This cylinder is also cushioned at both ends.

Double Rod End In general, the model number is read left to right corresponding to the cylinder as viewed from left to right with the primary end at rod end #1. See Double Rod Models information page in this section. For this option the piston rod number, piston rod end, and piston rod threads are to be specified for both ends. The simplest are for symmetric cylinders such as: TD, C, E, F, G, and CB mounts. All other mounting styless, the description of the first rod end will be at the mounting end. In the case of multiple mounts, the description of the first rod end will be at the primary mounting end. For "DD" mounts, the description of the first rod end will be the same location as the "XI" dimension.

Example: 4.00 KDD2HLT24A/18A x 10.000 XI=8

This is a center trunnion mounting cylinder with the XI dimension measured from the code 2 rod side of the cylinder which has the style 4 thread. The opposite end code 1 rod with the style 8 thread.

Style 3 Rod End

A style 3 rod end indicates a special rod end configuration. All special piston rod dimensions must have **all three:** KK; A; W/WF or LA/LAF specified with the rod fully retracted. A sketch or drawing should be submitted for rod ends requiring special machining such as snap ring grooves, keyways, tapers, multiple diameters, etc. It is good design practice to have this machining done on a diameter at least 0.065 inches smaller than the piston rod diameter. This allows the piston rod to have a chamfer preventing rod seal damage during assembly or maintenance. Standard style 55 rod ends with a longer than standard WG dimension should call out a style 3 rod end and the note: **same as 55 except WG=____**. A drawing should be submitted for special 55 rod ends that have specific tolerances or special radii. Special rod ends that have smaller than standard male threads, larger than standard female threads, or style 55 rod ends with smaller than standard AF or AE dimensions are to be reviewed by Engineering for proper strength at operating pressure.

Service Policy

On cylinders returned to the factory for repairs, it is standard policy for the Cylinder Division to make such part replacements as will put the cylinder in as good as new condition. Should the condition of the returned cylinder be such that expenses for repair would exceed the costs of a new one, you will be notified.

Address all correspondence and make shipments to, Service Department at your nearest regional plant listed in the pages of this catalog.

Certified Dimensions

Parker Cylinder Division guarantees that all cylinders ordered from this catalog will be built to dimensions shown. All dimensions are certified to be correct, and thus it is not necessary to request certified drawings.

For additional information – call your local Parker Cylinder Distributor.

Series "2H" Model Numbers – How to Develop Them – How to "Decode" Them

Parker Series 2H cylinders can be completely and accurately described by a model number consisting of coded symbols. To develop a model number, select only those symbols that represent the cylinder required, and place them in the sequence indicated below.

Note: Page numbers with a letter prefix, ie: C77, are located in section C of this catalog.

Feature	Description	Page No.	Symbol
Bore*	Specify in inches		
Cushion-Head	Used **only** if cushion required	C94,42 & 43	C
Double-Rod	Used **only** if double-rod cylinder is required	58	K
Mounting* Style	Head Tie Rods Extended	44	TB
	Cap Tie Rods Extended	44	TC
	Both End Tie Rods Extended	44	TD
	Head Rectangular Flange	46	J
	Head Square Flange	46	JB
	Head Rectangular	46	JJ
	Cap Rectangular Flange	48	H
	Cap Square Flange	48	HB
	Cap Rectangular	48	HH
	Side Lugs	50	C†
	Centerline Lugs	50	E
	Side Tapped	50	F†
	Side End Angles	52	CB
	Side End Lugs	52	G†
	Cap Fixed Clevis	52	BB
	Head Trunnion	54	D
	Cap Trunnion	54	DB
	Intermediate Fixed Trunnion‡	54	DD
	Spherical Bearing	56	SB
Modifications Mounting	Used **only** for Thrust Key (Styles C,F,G, & CB)	C93	P
	Used **only** for Manifold Port O-Ring Seal (Style C)	C91	M
Combination Mounting Style	Any Practical Mounting Style	–	As
	Listed Above	–	listed
		–	above
Series*	Used in **all** 2H Model Numbers	–	–2H
Piston	Ring packed piston standard	–	C
	Used **only** for Lipseal® Piston	43	L
	Used **only** for Hi-Load Piston	43	K
Ports*	SAE Straight Thread O-Ring Port (Standard)	C89	T
	Used **only** for NPTF (Dry Seal Pipe Thread)	C89	U
	Used **only** for BSP (Parallel Thread ISO 228)	C89	R
	Used **only** for SAE Flange Ports (3000 psi)	C89	P
	Used **only** for BSPT (Taper Thread)	C89	B
	Used **only** for Metric Thread	C89	G
	Used **only** for Metric Thread per ISO 6149	C89	Y
Common Modifications	High Water Content Fluid	C83	J
	Nut Retained Piston	43	F
	Fluorocarbon Seals	C83	V
	Water Service	C83	W
	EPR Seals	C83	X
Special Modifications	Used **only** if special Modifications are required: Oversize Ports	C91	S
	Port Position Change	C89	
	Special Seals	C83	
	Stop Tube•	C95	
	Stroke Adjuster	C93	
	Tie Rod Supports	C93	
Piston Rod* Number	For Single Rod Cylinders, select one only.	–	1
	Refer to Rod number listing, Table 2,	–	2

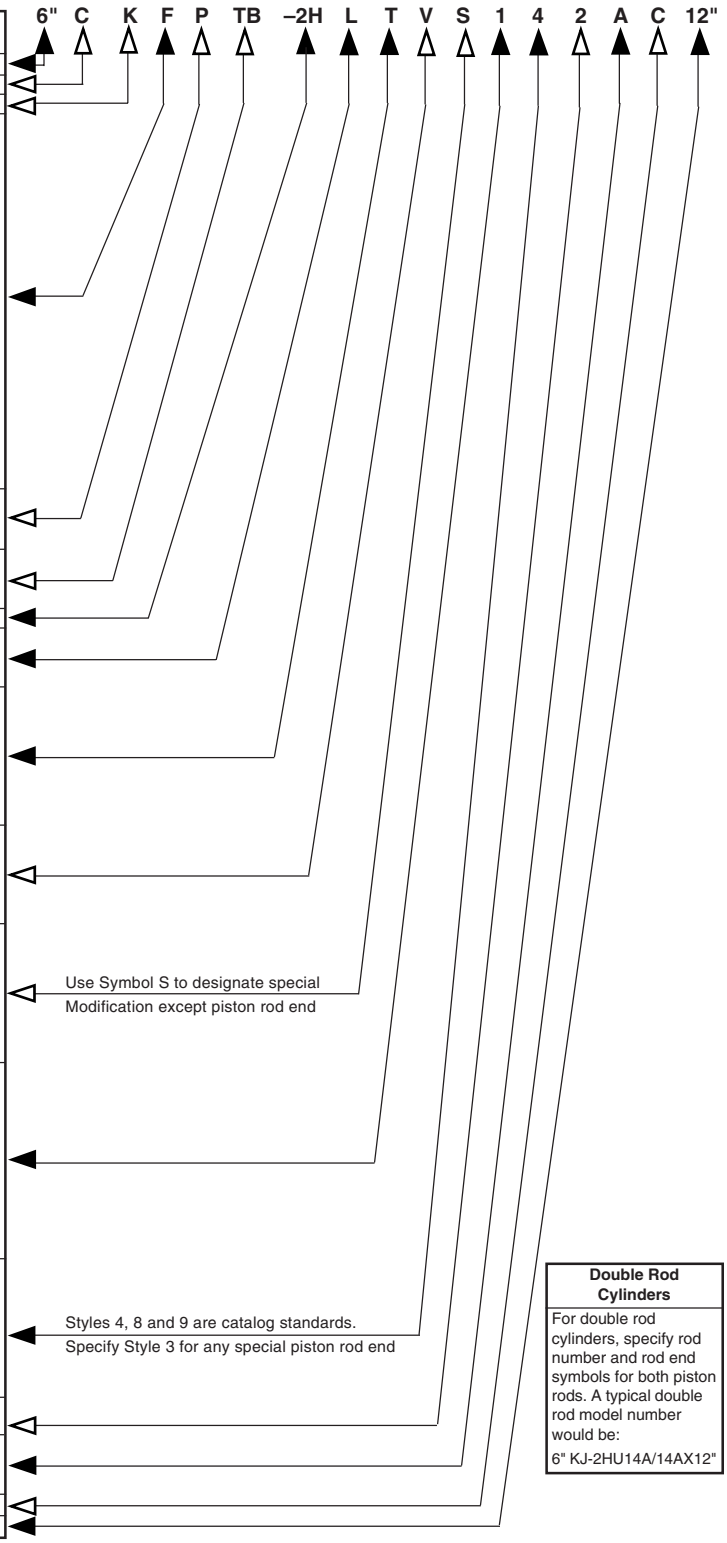
	Style 7 Female Thread for Spherical Rod Eye	B56	7
	Style 8 Intermediate Male	C92	8
	Style 9 Short Female	C92	9
	Style 55 Rod End for Flange Coupling	C19	55
	Style 3 Special (Specify)	C92	3
Piston Rod Alternate Thds.	Used **only** for stud two times longer than standard.	C92	2
Piston Rod* Threads	UNF Standard	C92	A
	BSF (British Fine)	C92	W
	Metric	C92	M
Cushion-Cap	Used **only** if cushion required	C94, 42 & 43	C
Stroke* •	Specify in inches	C93	–



Double Rod Cylinders

For double rod cylinders, specify rod number and rod end symbols for both piston rods. A typical double rod model number would be:

6" KJ-2HU14A/14AX12"

*Required for Basic Cylinder Model Number

•In case of Stop Tube, call out Gross Stroke Length

†Cylinders with these mounting styles should have a minimum stroke length equal to or greater than their bore size.

Dark Arrows Indicate Basic Minimum Model Number

‡Specify XI dimension

For Cylinder Division Plant Locations – See Page II.

Parker TS-2000 seal designed to eliminate cylinder rod seal leakage.

Parker Series 2H Heavy Duty and Series 3L Medium Duty Hydraulic Cylinders with the TS-2000 seal offers positive protection against cylinder rod leakage under the most demanding applications.

The TS-2000 seal is the product of countless hours of research, development and extensive field testing and is only available on Parker Cylinders.

Based on the popular Parker Serrated Lipseal rod design, the TS-2000 incorporates the pressure-compensated, uni-directional characteristics of a U-cup with the multiple edge sealing effectiveness of compression-type stacked-packings.

The goal for the Parker team was to design a rod seal suitable for all types of applications, regardless of pressure profile. It had to be composed of a material that would not react chemically with hydraulic fluids. And it had to produce better and more reliable "dry rod" performance than the standard serrated lip-seal design in a broad range of applications.

"Jewel" gland with wiperseal and TS-2000 cylinder rod seal.

The result is the TS-2000 seal, designed especially to eliminate rod seal leakage in the most demanding applications. It features a special polyurethane material that will not react chemically with petroleum-based hydraulic fluid, is extremely resistant to abrasion and extrusion, and provides exceptional service life. It has more sealing edges than other seals on the market, which in turn produces "dry rod" performance. The seal geometry was refined for maximum stability in the groove and has excellent performance characteristics throughout a broad range of pressures and piston rod velocities.

The Parker design team was successful!

TS-2000 rod seal has not failed in any of the test applications in the lab or on the job, no matter how tough or demanding.

For more information on the TS-2000 call or write your local Parker distributor or Parker Hannifin Corporation, Cylinder Division, 500 S. Wolf Road, Des Plaines, IL 60016, 847-298-2400.

Parker Series 2A Air Cylinder

When the job calls for reliable, heavy-duty performance, specify Series 2A. A 100,000 psi yield strength chrome-plated, case-hardened piston rod. A 125,000 psi yield strength rod-end stud with rolled threads. 100,000 psi yield strength tie rods. With construction like this, the Parker Series 2A is rated for air service to 250 psi. This is one heavy-duty air cylinder that's really heavy duty.

They're truly premium quality cylinders, factory prelubricated for millions of maintenance-free cycles. And to make sure every cylinder is premium quality, we subject each and every one – not just batch samples – to tough inspection and performance tests. See pages 18 and 19 for the inside story on all the features that make Series 2A the high performance, long lasting choice for all your heavy-duty air applications.

For additional information – call your local Parker Cylinder Distributor.

Standard Specifications

- Heavy Duty Service – ANSI/(NFPA) T3.6.7R2-1996 Specifications and Mounting Dimension Standards
- Standard Construction – Square Head – Tie Rod Design
- Nominal Pressure – Up to 250 PSI Air Service
- Standard Fluid – Filtered Air
- Standard Temperature – -10°F. to +165°F.
- Bore Sizes – 1" through 14" (Larger sizes available)

In line with our policy of continuing product improvement, specifications in this catalog are subject to change.

- Piston Rod Diameter – 1/2" through 5 1/2"
- Mounting Styles – 17 standard styles at various application ratings
- Strokes – Available in any practical stroke length
- Cushions – Optional at either end or both ends of stroke. "Float Check" at cap end.
- Rod Ends – Three Standard Choices – Specials to Order

*See section C, "Operating Fluids and Temperature Range" for higher temperature service.

Note: Series 2A Air Cylinders fully meet ANSI/(NFPA) T3.6.7R2-1996 Specifications and Mounting Dimension Standards for Square Head Industrial Fluid Power Cylinders.
Parker Style TB, JB, HB, C, DB, and BB are available in 7" bore size, see page 32.

Parker Cylinder

The inside story on why Series 2A is your best choice in heavy duty pneumatic cylinders

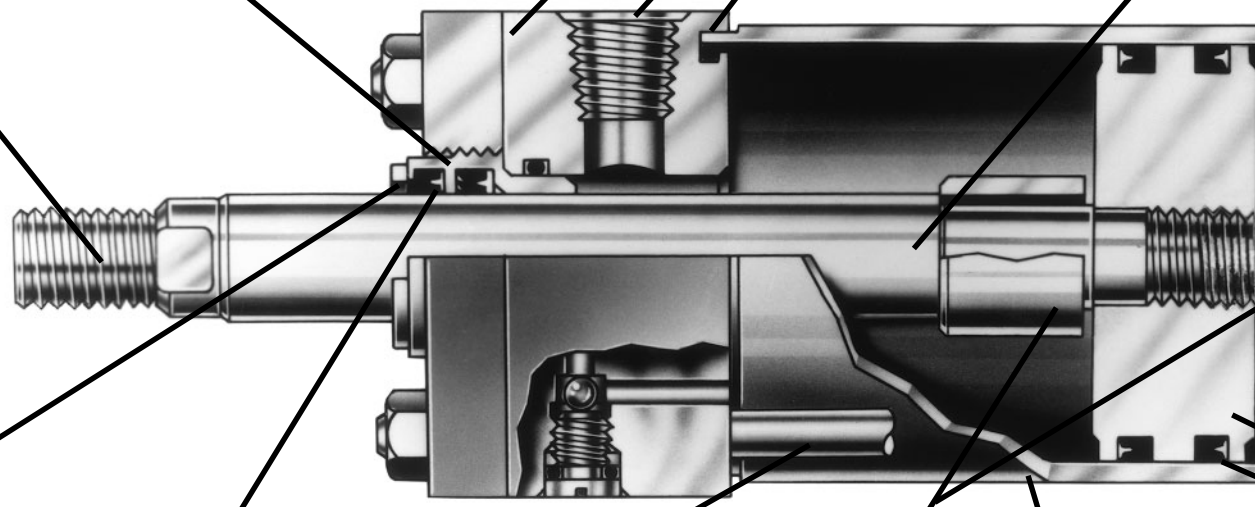
Steel Head – Bored and grooved to provide concentricity for mating parts.

Ports – NPTF ports are standard.

End Seals – Pressure-actuated cylinder body-to-head and cap "O" rings.

Primary Seal – Unique Serrated Lipseal® is a proven leakproof design, (Parker Patent #2997318) – completely self-compensating and self-relieving to withstand variations and conform to mechanical deflection that may occur.

Piston Rod Stud – Furnished on 2" diameter rods and smaller when standard style #4 rod end threads are required or on $1^{3}/_{8}$" diameter rods and smaller when style #8 threads are required. Also available in 2 times the catalog "A" dimension length. Studs have rolled threads and are made from high strength steel. Anaerobic adhesive is used to permanently lock the stud to the piston rod.



"Jewel" Rod Gland Assembly – Externally removable without cylinder disassembly. Long bearing surface is inboard of the seals, assuring positive lubrication from within the cylinder. An "O" ring is used as a seal between gland and head, and also serves as a prevailing torque-type lock.

Secondary Seal – Double-Service Wiperseal® (Parker Patent #2907596) – acts as a secondary pressure seal on the extend stroke and cleans the rod on the return stroke.

High Strength Tie Rods – Made from 100,000 psi minimum yield steel with rolled threads for added strength.

Adjustable Floating Cushions – Cushions are optional and can be supplied at head end, cap end, or both ends without change in envelope or mounting dimensions.

The Cylinder Body – Hard chrome-plated bore, steel tubing honed to a 15 micro inch finish on $1^{1}/_{2}$" through 14" bore sizes. 1" bore size is aluminum with hard-coated bore.

Adjustable floating cushions

Cushions are optional, and can be supplied at head end, cap end, or both ends without change in envelope or mounting dimensions. All Parker cushions are adjustable.

The Series 2A cylinder design incorporates the longest cushion sleeve and cushion spear that can be provided in the standard envelope without decreasing the rod bearing and piston bearing lengths.

(1) When a cushion is specified at the head end:

a. A self-centering sleeve is furnished on the piston rod assembly.

b. A needle valve is provided that is flush with the side of the head when wide open. It may be identified by the fact that it is socket-keyed. It is located on side number 2, in all mounting styles except D, DB, DD, and E. In these styles it is located on side number 3.

c. A springless check valve is provided that is also flush with the side of the head and is mounted adjacent to the needle valve except on certain bores of mounting style C where it is mounted opposite the needle valve. It may be identified by the fact that it is slotted.

d. The check and needle valves are interchangeable in the head.

(2) When a cushion is specified at the cap end:

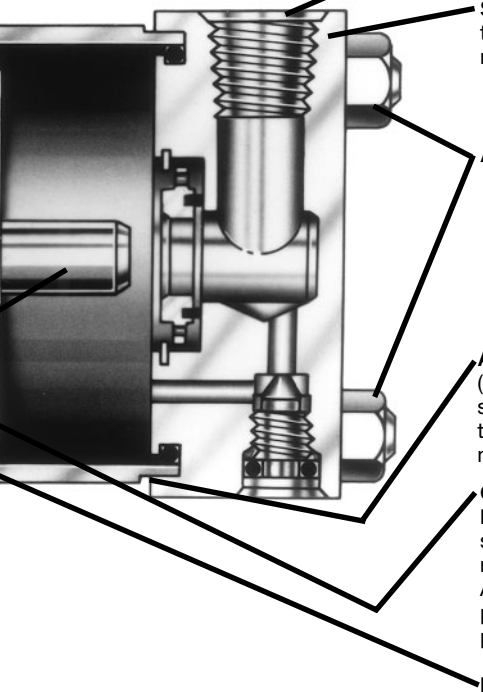
a. A cushion spear is provided on the piston rod assembly.

b. A "float check" self-centering bushing is provided which incorporates a large flow check valve for fast "out-stroke" action.

c. A socket-keyed needle valve is provided that is flush with the side of the cap when wide open. It is located on side number 2 in all mounting styles except D, DB, DD, and E. In these styles it is located on side number 3.

For additional information – call your local Parker Cylinder Distributor.

Piston Rod – Medium carbon steel, induction case-hardened to 54 R_C, hard chrome-plated and polished to 10 RMS finish. Piston rods are made from 90,000 to 100,000 psi minimum yield material in 1/2" through 4" diameters. Larger diameters vary between 57,000 and 90,000 psi minimum material, depending on rod diameter. The piston thread equals the catalog style #4 rod end thread for each rod diameter to assure proper piston-to-rod thread strength. Two wrench flats are provided for rod end attachment.



Ports – NPTF ports are standard.

Steel Cap – Bored and grooved to provide concentricity for mating parts.

Alloy Steel Tie Rod Nuts

Align-A-Groove – (Patent #3043639) – A 3/16" wide surface machined at each end of the cylinder body. Makes precise mounting quick and easy.

One-Piece Nodular Iron Piston – The wide piston surface contacting cylinder bore reduces bearing loads. Anaerobic adhesive is used to permanently lock and seal the piston to the rod.

Piston Lipseal – Fully dynamic and self-compensating for variations in pressure, mechanical deflections and wear.

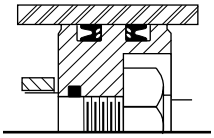
The exclusive "Jewel" gland gives you longer cylinder life, better performance and lower costs.

An extra-long inboard bearing surface insures lubrication from within the cylinder. Outboard of the bearing surface are two leakproof seals – The Lipseal and Wiperseal. The serrated Lipseal (primary seal) is completely self-compensating and self-relieving. It adjusts to mechanical deflections or any pressure variation from near-zero to rated operating pressure. The result is positive, no-leak sealing – regardless of conditions.

The Wiperseal does double duty. On the advance stroke, it acts as a secondary pressure seal. On the return, it wipes away any dirt on the rod. This means less wear on bearing surfaces and internal parts. Longer life for working parts. And, less loss of fluid. Plus, you can replace a "Jewel" gland without removing the tie rods or the retainer. Just a few twists with a spanner wrench does the job.

Prelubricated Wearing Surfaces

Parker Series 2A Air Cylinders are factory prelubricated. Lube-A-Cyl applied to seals, piston, cylinder bore, piston rod and gland surfaces provides lubrication for normal operation. Lube-A-Cyl has been field and laboratory tested, and is recommended by Parker for air cylinders where lubricant should remain in the cylinder and not be expelled into the atmosphere.



Piston with Retainer Nut – Optional at extra charge.

A

Cushion Length

Cylinder Bore (Inches)	Rod Diameter* (Inches)	Rod Number	Cushion Length (Inches)	
			Head*	Cap

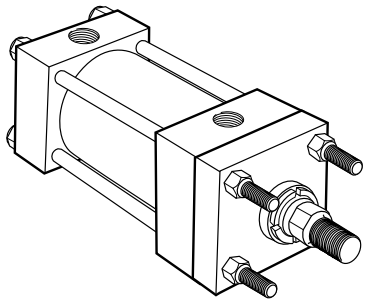
*Head end cushions for rod diameters not listed have cushion lengths with the limits shown.
For cushion selection and sizing see Section C.

For Cylinder Division Plant Locations – See Page II.

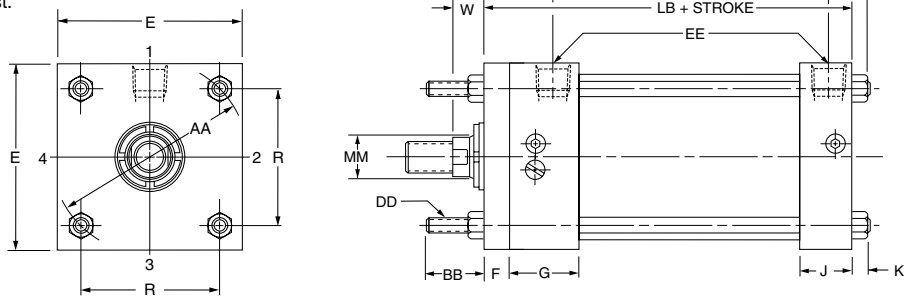
Parker Cylinder

Tie Rods Extended

Style TB
(NFPA Style MX3)



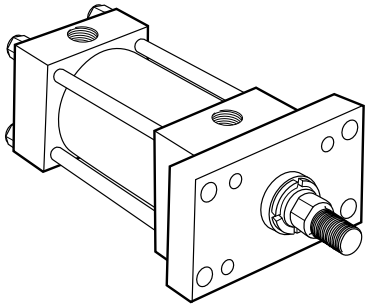
Basic Mounting (T) —
NFPA MX0 — no tie rods extended can be supplied upon request.

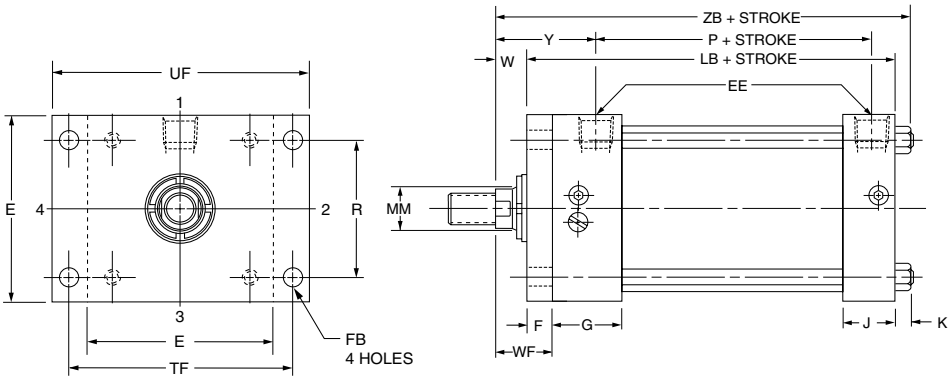


Style TB (NFPA MX3). Head Tie Rods Extended, illustrated: Style TC (NFPA MX2), Cap Tie Rods Extended; and Style TD (NFPA MX1), Both Ends Tie Rods Extended are also available. All "T" styles can be dimensioned from Style TB drawing at right.

Head Rectangular Flange

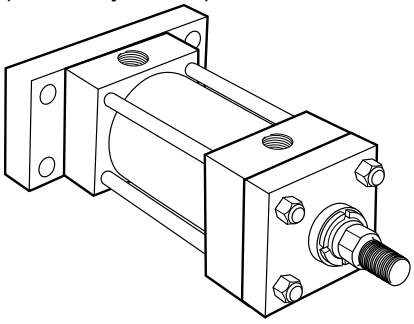
Style J
(NFPA Style MF1)

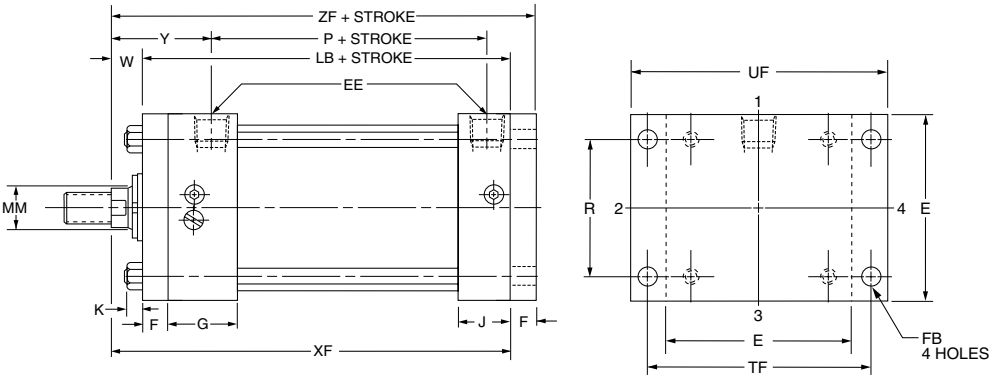




Cap Rectangular Flange

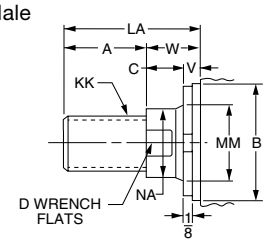
Style H
(NFPA Style MF2)



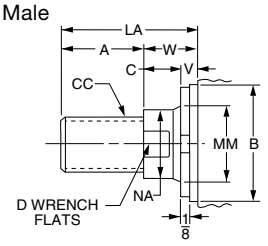


Rod End Dimensions — see table 2

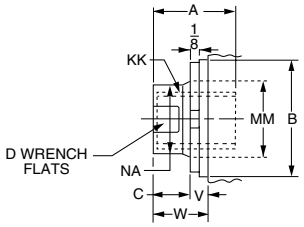
Thread Style 4
(NFPA Style SM)
Small Male



Thread Style 8
(NFPA Style IM)
Intermediate Male



Thread Style 9
(NFPA Style SF)
Small Female



A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through 1 3/8" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder. When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

"Special" Thread Style 3

Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensioned sketch.

For additional information – call your local Parker Cylinder Distributor.

A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through 1 3/8" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder. When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

"Special" Thread Style 3

Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensioned sketch.

For additional information – call your local Parker Cylinder Distributor.

A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through 1 3/8" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder. When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

"Special" Thread Style 3
Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensioned sketch.

For additional information – call your local Parker Cylinder Distributor.

A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through 1 3/8" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder. When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

"Special" Thread Style 3

Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensioned sketch.

For additional information – call your local Parker Cylinder Distributor.

Table 3 — Envelope and Mounting Dimensions

* Mounting style CB available in 1" bore for rod No. 1 only.
• Mounting style G not available in 1" bore.
Caution: When using mounting styles CB and G, check clearance between mounting members and rod attachment or accessory. If necessary, specify longer rod extension to avoid interference with mounting members.

For Cylinder Division Plant Locations – See Page II.

A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through 1 3/8" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder. When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

"Special" Thread Style 3
Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensioned sketch.

For additional information – call your local Parker Cylinder Distributor.

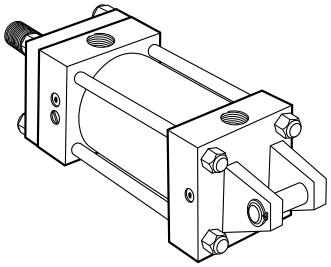
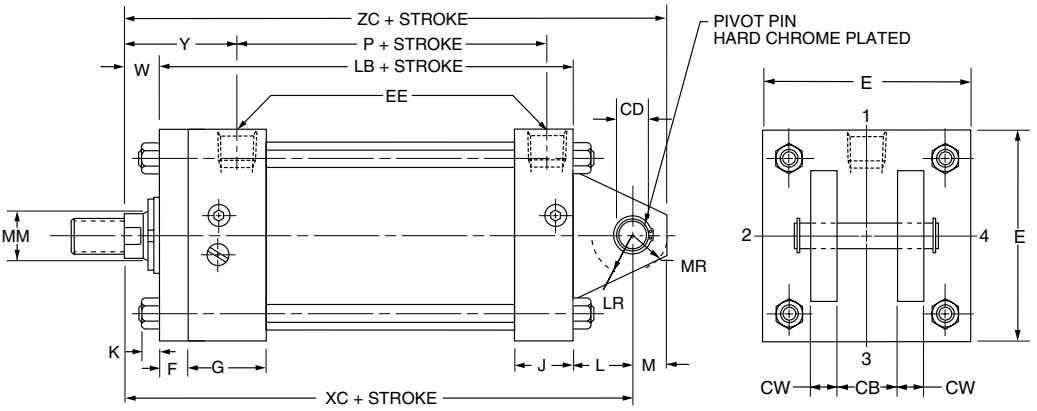
* Mounting style DD not available in 1" bore.
**Dimension XI to be specified by customer.

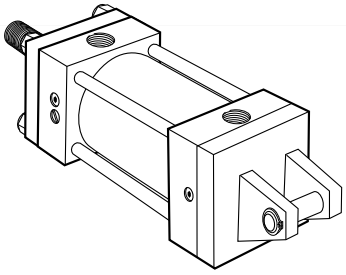
Cap Fixed Clevis
Style BB
(NFPA Style MP1)

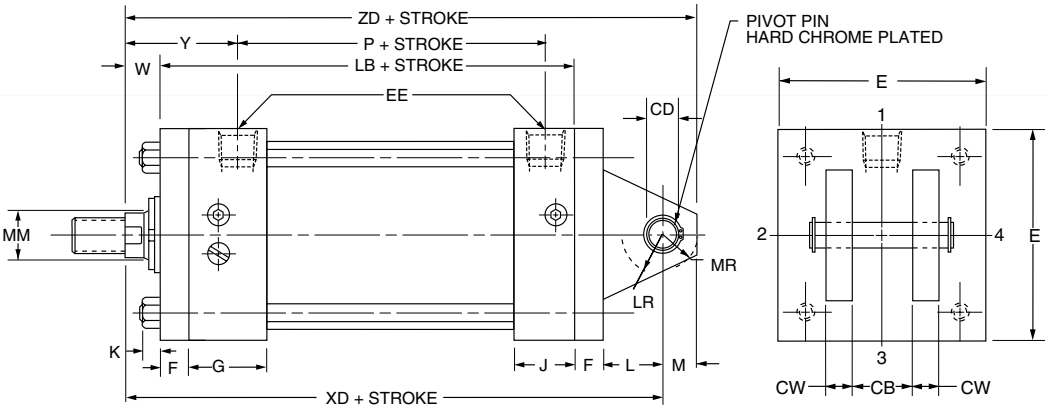




The 1", 4", 5" and 6" bore sizes have tie rod nuts at both ends as shown. Tie rods thread into cap on all other bore sizes.

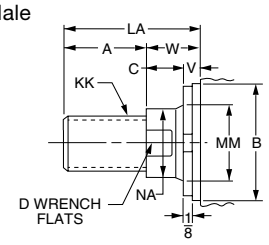
Cap Detachable Clevis
Style BC
(NFPA Style MP2)



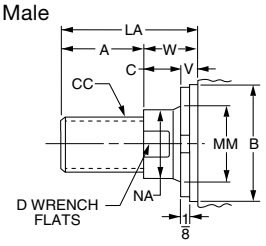


Rod End Dimensions — see table 2

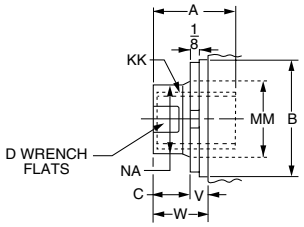
Thread Style 4
(NFPA Style SM)
Small Male



Thread Style 8
(NFPA Style IM)
Intermediate Male



Thread Style 9
(NFPA Style SF)
Small Female



A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through 1 3/8" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder. When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

"Special" Thread Style 3
Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensioned sketch.

For additional information – call your local Parker Cylinder Distributor.

* Cushions not available on 1" bore.
** On 1", 1 1/2", 2" and 2 1/2" bore sizes, the head-end (only) pipe thread is not full depth on cylinders with No. 2 rods. Minimum of three full threads available.
† In 1" bore size model only, a single eye mounting, 7/16" thick, is used. Dimension CD (.441") is hole diameter – pin not supplied.
• Dimension CD is pin diameter except in 1" bore. ■1" bore head dimension is 1 3/4" x 1 1/2". See page B20.

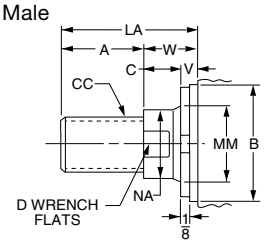
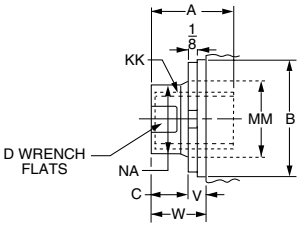
Thread Style 8
(NFPA Style IM)
Intermediate Male



Thread Style 9
(NFPA Style SF)
Small Female



A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through 1 3/8" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder. When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

"Special" Thread Style 3

Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensional sketch.

For additional information – call your local Parker Cylinder Distributor.

A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through 1 3/8" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder. When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

"Special" Thread Style 3

Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensional sketch.

For additional information – call your local Parker Cylinder Distributor.

A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through 1 3/8" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder. When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

"Special" Thread Style 3
Special thread, extension, rod eye, blank, etc., are also available.

To order, specify Style 3"and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensional sketch.

For additional information – call your local Parker Cylinder Distributor.

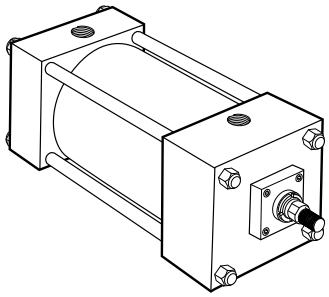
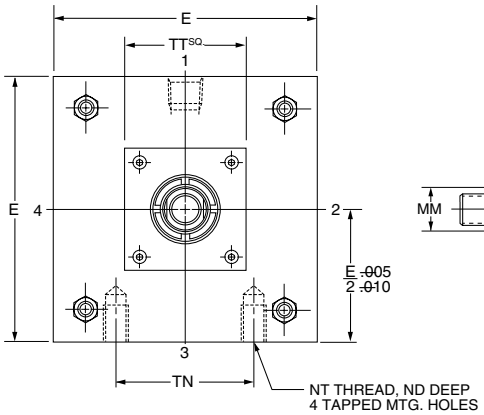
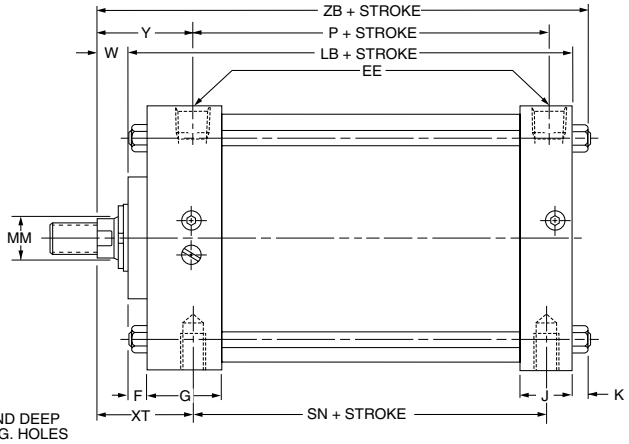
Side Tapped

Style F
(NFPA Style MS4)



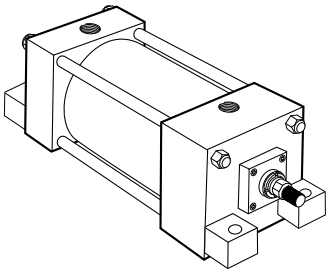


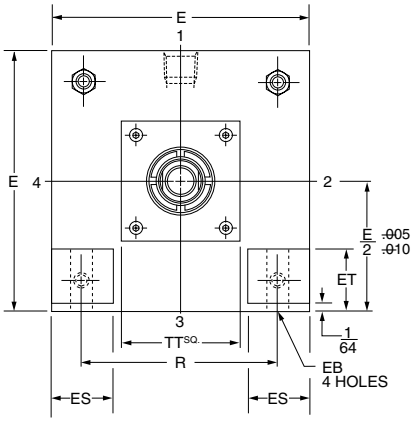


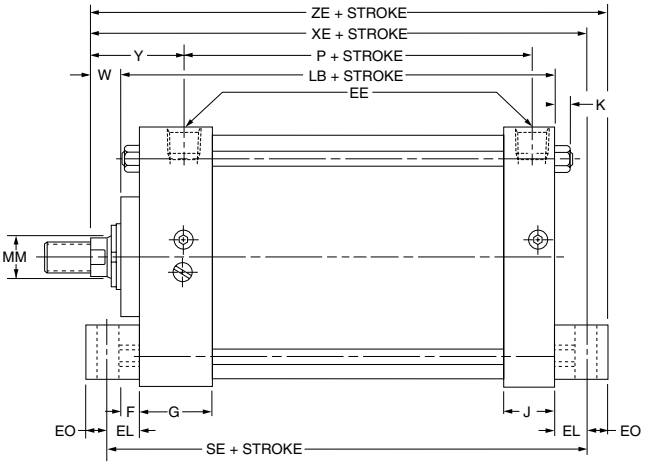
Side End Lugs

Style G
(NFPA Style MS7)

Cylinders with this mounting style are mounted on the precision ground surfaces of the head and cap. There must be a minimum gap of at least $^{1}/_{64}$ of an inch between the bottom of the lug and the mounting surface before the mounting bolts are tightened.



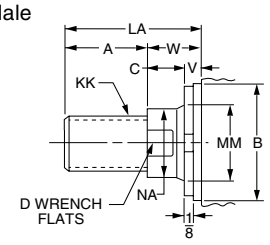




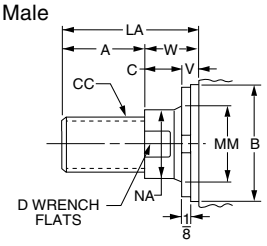
Not offered in the following sizes: 8" bore, rod codes #2, 6, 7, 8, 9 and 0; 10" bore, rod codes #8, 9 and 0; and 12" bore, rod codes #7, 8 and 9.

Rod End Dimensions — see table 2

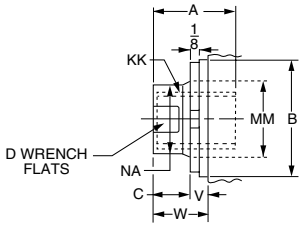
Thread Style 4
(NFPA Style SM)
Small Male



Thread Style 8
(NFPA Style IM)
Intermediate Male



Thread Style 9
(NFPA Style SF)
Small Female



A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through $1^{3}/_{8}$" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder. When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

Special Thread Style 3

Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensional sketch.

For additional information – call your local Parker Cylinder Distributor.

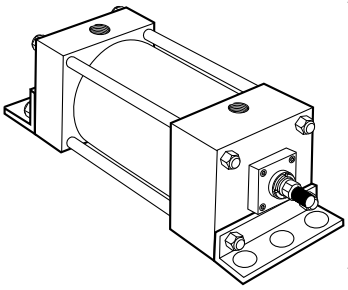
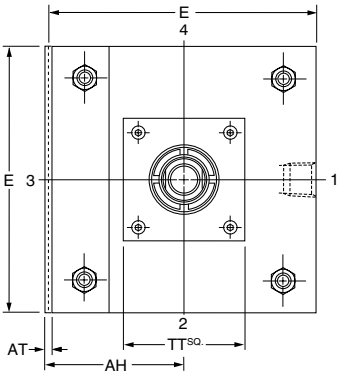
* Mounting style G not offered in this rod size.

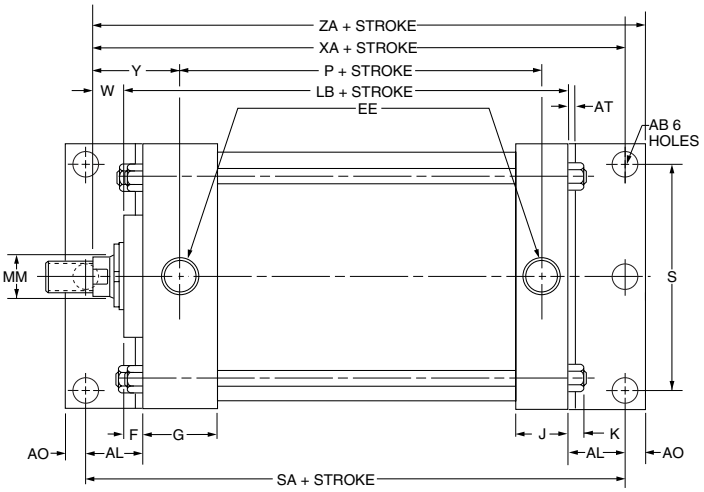
Caution: When using mounting style G, check clearance between mounting members and rod attachment or accessory. If necessary, specify longer rod extension to avoid interference with mounting members.

Side End Angles

Style CB
(NFPA Style MS1)



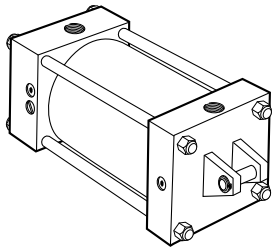


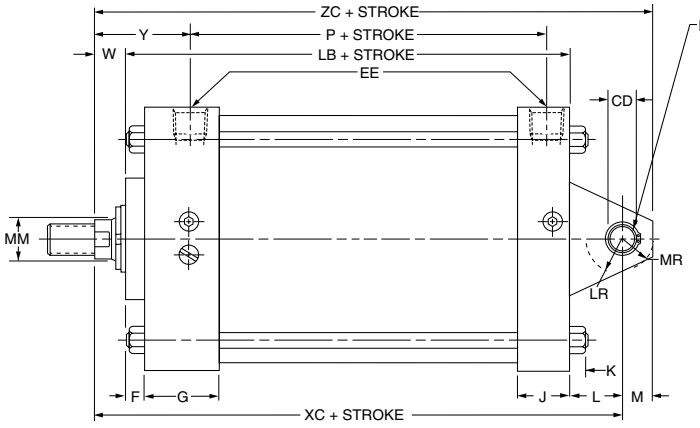


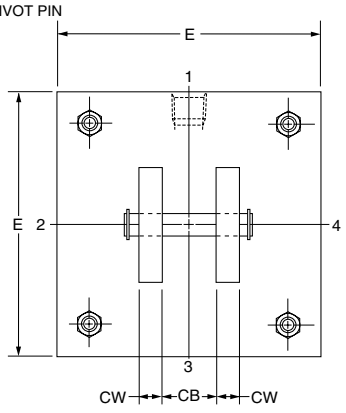
Not offered in the following sizes: 8" bore, rod codes #2, 6, 7, 8, 9 and 0; 10" bore, rod codes #8, 9 and 0.

Cap Fixed Clevis

Style BB
(NFPA Style MP1)

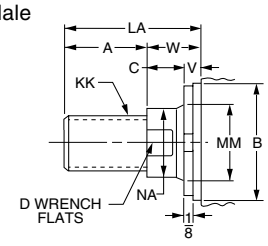




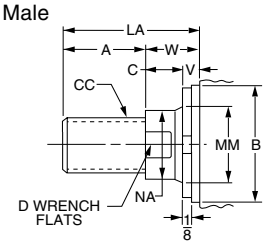


Rod End Dimensions — see table 2

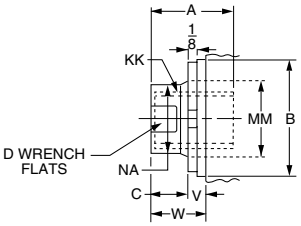
Thread Style 4
(NFPA Style SM)
Small Male



Thread Style 8
(NFPA Style IM)
Intermediate Male



Thread Style 9
(NFPA Style SF)
Small Female



A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through 1 3/8" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder. When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

"Special" Thread Style 3

Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensional sketch.

For additional information – call your local Parker Cylinder Distributor.

* Mounting style G not offered in this rod size.

Caution: When using mounting style G, check clearance between mounting members and rod attachment or accessory. If necessary, specify longer rod extension to avoid interference with mounting members.

A high strength rod end stud is supplied on thread style 4 through 2" diameter rods and on thread style 8 through 1 3/8" diameter rods. Larger sizes or special rod ends are cut threads. Style 4 rod ends are recommended where the workpiece is secured against the rod shoulder. When the workpiece is not shouldered, style 4 rod ends are recommended through 2" piston rod diameters and style 8 rod ends are recommended on larger diameters. Use style 9 for applications where female rod end threads are required. If rod end is not specified, style 4 will be supplied.

"Special" Thread Style 3
Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for CC or KK, A and LA. If otherwise special, furnish dimensional sketch.

For additional information – call your local Parker Cylinder Distributor.

Maximum operating pressure at 4:1 design factor is based on tensile strength of material. Pressure ratings are based on standard commercial bearing ratings.
Note: For additional dimensions see Series 2A, page 30.
* Dimension CD is hole diameter.
** Corresponding rod eye pin diameter may not match pin diameter of cap.
Rod No. 1 is standard.

For additional information – call your local Parker Cylinder Distributor.

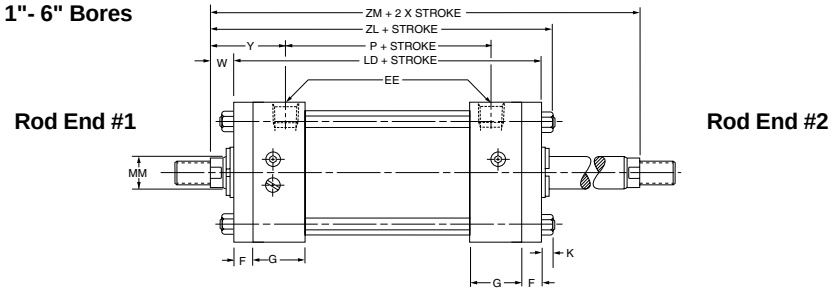
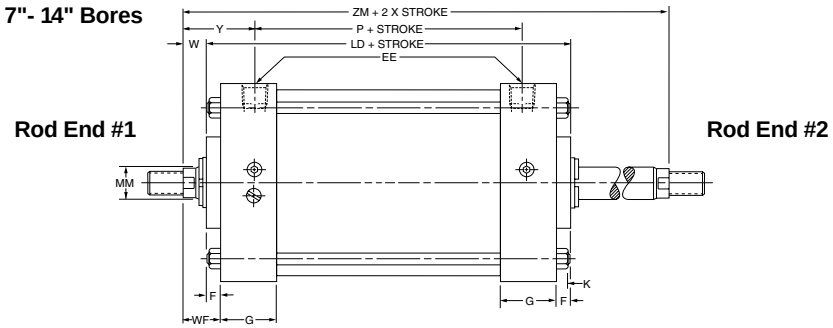
†Specify XI dimension from rod end #1.

How to Use Double Rod Cylinder Dimensioned Drawings

1"- 6" Bores

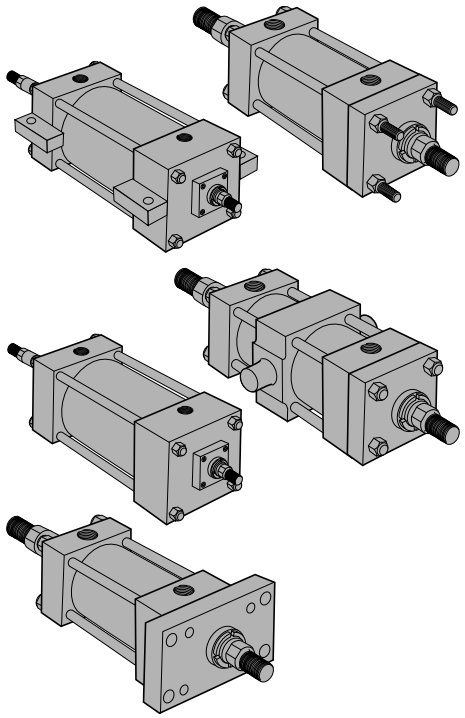


7"- 14" Bores



To determine dimensions for a double rod cylinder, first refer to the desired single rod mounting style cylinder shown on preceding pages of this catalog. (See table at left.) After selecting necessary dimensions from that drawing, return to this page supplement the single rod dimensions with those shown on drawings at right and dimension table below. Note that double rod cylinders have a head (Dim. G) at both ends and that dimension LD replace LB and ZL replaces ZB, etc. The double rod dimensions differ from, or are in addition to those for single rod cylinders shown on preceding pages and provide the information needed to completely dimension a double rod cylinder.

On a double rod cylinder where the two rod ends are different, be sure to clearly state which rod end is to be assembled at which end. Port position 1 is standard. If other than standard, specify pos. 2, 3 or 4 when viewed from rod end #1 only. See port position information in Section C.



All dimensions are in inches and apply to Code 1 rod sizes only. For alternate rod sizes, determine all envelope dimensions (within LD dim.) as described above and then use appropriate rod end dimensions for proper rod size from single rod cylinder.

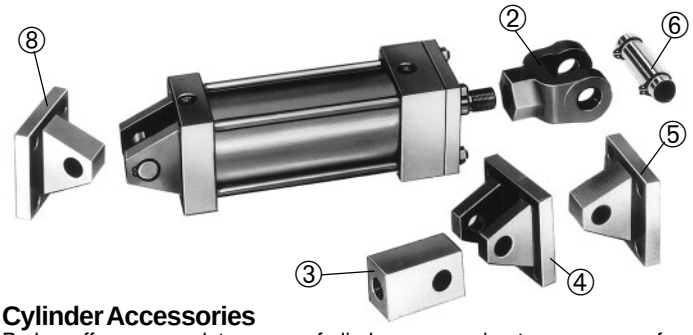
Series 2A
Heavy Duty Air Cylinders



Cylinder Accessories

Parker offers a complete range of cylinder accessories to assure you of greatest versatility in present or future cylinder applications.

Rod End Accessories

Accessories offered for the rod end of the cylinder include Rod Clevis, Eye Bracket, Knuckle, Clevis Bracket and Pivot Pin. To select the proper part number for any desired accessory, refer to Chart A below and look opposite the thread size of the rod end as indicated in the first column. The Pivot Pins, Eye Brackets and Clevis Brackets are listed opposite the thread size which their mating Knuckles or Clevises fit.

†For alignment coupler dimensions, see Section C.

*Cylinder accessory dimensions conform to NFPA recommended standard NFPA/T3.6.8 R1-1984, NFPA recommended standard fluid power systems - cylinder - dimensions for accessories for cataloged square head industrial types. Parker adopted this standard in April, 1985. Eye Brackets or Mounting Plates shipped before this date may have different dimensions and will not necessarily interchange with the NFPA standard. For dimensional information on older style Eye Brackets or Mounting Plates consult Drawing #144805 or previous issues of this catalog.

NOTE: For economical accessory selection, it is recommended that rod end style 4 be specified on your cylinder order.

Accessory Load Capacity

The various accessories on Pages 48 and 49 have been load rated for your convenience. The load capacity in lbs. shown on page 49, is the recommended maximum load for that accessory based on a 4:1 design factor in tensions. (Pivot Pin is rated in shear.) Before specifying, compare the actual load or the tension (pull) force at maximum operating pressure of the cylinder with the load capacity of the accessory you plan to use. If load or pull force of cylinder exceeds load capacity of accessory, consult factory.

Mounting Plates

Mounting Plates for Style BB and Style BC (Clevis mounted) cylinders are offered. To select proper part number for your application, refer to Chart B, above right.

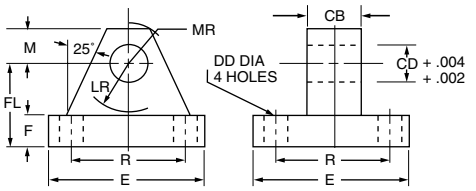
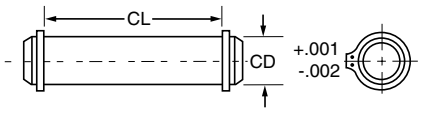
Order to fit Knuckle.

⑧ Mounting Plate or ⑤ Eye Bracket



1. When used to mate with the Rod Clevis, select from Chart A.
2. When used to mount the Style BB or BC cylinders, select from the Mounting Plate Selection Table. See Chart B at lower left.

⑥ Pivot Pin



1. Pivot Pins are furnished with Clevis Mounted Cylinders as standard.
2. Pivot Pins are furnished with (2) Retainer Rings.
3. Pivot Pins must be ordered as a separate item if to be used with Knuckles, Rod Clevises, or Clevis Brackets.

For additional information – call your local Parker Cylinder Distributor.

*Cylinder accessory dimensions conform to NFPA recommended standard NFPA/T3.6.8 R1-1984, NFPA recommended standard fluid power systems - cylinder - dimensions for accessories for cataloged square head industrial types. Parker adopted this standard in April, 1985. Eye Brackets or Mounting Plates shipped before this date may have different dimensions and will not necessarily interchange with the NFPA standard. For dimensional information on older style Eye Brackets or Mounting Plates consult Drawing #144805 or previous issues of this catalog.

⊖ See Accessory Load Capacity note on page 48.

† These sizes supplied with cotter pins.

‡ Includes Pivot Pin.

• Consult appropriate cylinder rod end dimensions for compatibility

How to Order Series "2A" Cylinders

When ordering Series 2A cylinders, please review the following:

Note: Duplicate cylinders can be ordered by giving the SERIAL NUMBER from the nameplate of the original cylinder. Factory records supply a quick positive identification.

Piston Rods: Specify rod code number based on diameter. Give thread style number for a standard thread or specify dimensions. See "Style 3 Rod End" below.

Cushions: If cushions are required specify according to the model number on the next page. If the cylinder is to have a double rod and only one cushion is required, be sure to specify clearly which end of the cylinder is to be cushioned.

Special Modifications: Additional information is required on orders for cylinders with special modifications. This is best handled with descriptive notes. For further information, consult factory

Fluid Medium: Series 2A hydraulic cylinders are equipped with seals for use with lubricated air.

Class 1 Seals

Class 1 seals are the seals provided as standard in a cylinder assembly unless otherwise specified. For further information on fluid compatibility or operating limitations of all components, see section C.

For the 2A series cylinders the following make-up Class 1 Seals:

Primary Piston Rod Seal – Nitrile with PTFE back-up washers
Piston Rod Wiper – Nitrile
Piston Seals – Nitrile with polyester back-up washers
O-Rings – Nitrile

Combination Mountings

Single Rod End The first mounting is the one called out on the head end of the cylinder. The second or subsequent mountings are called out as they appear in the assembly moving away from the rod end. Exception: When tie rod mountings are part of a combination, the model number should contain an "S" (Special) in the model code and a note in the body of the order clarifying the mounting arrangement. The "P" is used to define a thrust key and is not considered to be a mounting. However, it is located at the primary end.

Example: 4.00 CCBB2ALTS14AC x10.000

Combination "C" mounting head only "BB" mounting cap end
This cylinder is also cushioned at both ends.

Double Rod End In general, the model number is read left to right corresponding to the cylinder as viewed from left to right with the primary end at rod end #1. See Double Rod Models information page in this section. For this option the piston rod number, piston rod end, and piston rod threads are to be specified for both ends. The simplest are for symmetric cylinders such as: TD, C, E, F, G, and CB mounts. All other mounting styles, the description of the first rod end will be at the mounting end. In the case of multiple mounts, the description of the first rod end will be at the primary mounting end. For "DD" mounts, the description of the first rod end will be the same location as the "XI" dimension.

Example: 4.00 KDD2ALT24A/18A x10.000 XI=8

This is a center trunnion mounting cylinder with the XI dimension measured from the code 2 rod side of the cylinder which has the style 4 thread. The opposite end code 1 rod with the style 8 thread.

Style 3 Rod End

A style 3 rod end indicates a special rod end configuration. All special piston rod dimensions must have **all three:** KK; A; W/WF or LA/LAF specified with the rod fully retracted. A sketch or drawing should be submitted for rod ends requiring special machining such as snap ring grooves, keyways, tapers, multiple diameters, etc. It is good design practice to have this machining done on a diameter at least 0.065 inches smaller than the piston rod diameter. This allows the piston rod to have a chamfer preventing rod seal damage during assembly or maintenance. Standard style 55 rod ends with a longer than standard WG dimension should call out a style 3 rod end and the note: **same as 55 except WG=____**. A drawing should be submitted for special 55 rod ends that have specific tolerances or special radii. Special rod ends that have smaller than standard male threads, larger than standard female threads, or style 55 rod ends with smaller than standard AF or AE dimensions are to be reviewed by Engineering for proper strength at operating pressure.

Service Policy

On cylinders returned to the factory for repairs, it is standard policy for the Cylinder Division to make such part replacements as will put the cylinder in as good as new condition. Should the condition of the returned cylinder be such that expenses for repair would exceed the costs of a new one, you will be notified.

Address all correspondence and make shipments to, Service Department at your nearest regional plant listed in the pages of this catalog.

Certified Dimensions

Parker Cylinder Division guarantees that all cylinders ordered from this catalog will be built to dimensions shown. All dimensions are certified to be correct, and thus it is not necessary to request certified drawings.

For additional information – call your local Parker Cylinder Distributor.

Series 2A Model Numbers – How to Develop Them – How to "Decode" Them

Parker Series 2A cylinders can be completely and accurately described by a model number consisting of coded symbols. To develop a model number, select only those symbols that represent the cylinder required, and place them in the sequence indicated below.

Note: Page numbers with a letter prefix, ie: C77, are located in section C of this catalog.

Feature	Description	Page No.	Symbol
Bore*	Specify in inches	—	—
Cushion-Head	Used **only** if cushion required	C101-103	C
Double-Rod	Used **only** if double-rod cylinder is required	A46	K

Double Rod Cylinders

For double rod cylinders, specify rod number and rod end symbols for both piston rods. A typical double rod model number would be:

6" KJ-2AU14A/14AX12"

*Required for Basic Cylinder Model Number

Dark Arrows Indicate Basic Minimum Model Number

‡Specify XI dimension

†In case of Stop Tube, call out gross stroke length.

Cylinder serial numbers are factory production record numbers and are assigned to each cylinder, in addition to the model number.

For Cylinder Division Plant Locations – See Page II.

- **D Betriebsanleitung**
- **GB Operating instructions**
- **F Manuel d`utilisation**
- **E Instrucciones de uso**
- **I Istruzioni per l`uso**
- **NL Gebruiksaanwijzing**

⚠ Sicherheitsbestimmungen

- Das Gerät darf nur von Personen installiert und in Betrieb genommen werden, die mit dieser Betriebsanleitung und den geltenden Vorschriften über Arbeitssicherheit und Unfallverhütung vertraut sind. Beachten Sie die VDE- sowie die örtlichen Vorschriften, insbesondere hinsichtlich Schutzmaßnahmen.
- Beim Transport, der Lagerung und im Betrieb die Bedingungen nach EN 60068-2-6 einhalten (s. technische Daten).
- Durch Öffnen des Gehäuses oder eigenmächtige Umbauten erlischt jegliche Gewährleistung.
- Montieren Sie das Gerät in einen Schaltschrank; Staub und Feuchtigkeit können sonst zu Beeinträchtigungen der Funktionen führen.
- Sorgen Sie an allen Ausgangskontakten bei kapazitiven und induktiven Lasten für eine ausreichende Schutzbeschaltung.
- Die Sicherheitsfunktion muss mindestens einmal im Monat ausgelöst werden.

⚠ Safety Regulations

- The unit may only be installed and operated by personnel who are familiar with both these instructions and the current regulations for safety at work and accident prevention. Follow VDE and local regulations especially as regards preventative measures.
- Transport, storage and operating conditions should all conform to EN 60068-2-6.
- Any guarantee is void following opening of the housing or unauthorised modifications.
- The unit should be panel mounted, otherwise dampness or dust could lead to function impairment.
- Adequate protection must be provided on all output contacts especially with capacitive and inductive loads.
- The safety function must be triggered at least once per month.

⚠ Conseils préliminaires

- La mise en oeuvre de l'appareil doit être effectuée par une personne spécialisée en installations électriques, en tenant compte des prescriptions des différentes normes applicables (NF, EN, VDE...) notamment au niveau des risques encourus en cas de défaillance de l'équipement électrique.
- Respecter les exigences de la norme EN 60068-2-6 lors du transport, du stockage et de l'utilisation de l'appareil.
- L'ouverture de l'appareil ou sa modification annule automatiquement la garantie.
- L'appareil doit être monté dans une armoire; l'humidité et la poussière pouvant entraîner des aléas de fonctionnement.
- Vérifiez que le pouvoir de coupure des contacts de sortie est suffisant en cas de circuits capacitifs ou inductifs.
- La fonctionn de sécurité doit être activée au moins une fois par mois.

Bestimmungsgemäße Verwendung

Das Sicherheitsschaltgerät PNOZ X3P ist bestimmt für den Einsatz in

- NOT-AUS-Einrichtungen
- Sicherheitsstromkreisen nach VDE 0113-1 und EN 60204-1 (z. B. bei beweglichen Verdeckungen)

Authorised Applications

The Safety Relay PNOZ X3P is for use in:

- Emergency Stop circuits
- Safety Circuits according to VDE 0113-1 and EN 60204-1 (e.g. with movable guards)

Domaines d'utilisation

Le bloc logique de sécurité PNOZ X3P est adapté pour :

- les circuits d'arrêt d'urgence
- les circuits de sécurité selon les normes NF 79-130 et EN 60204/1 (ex. protecteurs mobiles).

Gerätebeschreibung

Das Sicherheitsschaltgerät PNOZ X3P ist in einem P-99-Gehäuse untergebracht. Es kann mit 24 ... 240 V Gleichspannung oder Wechselspannung betrieben werden.
Merkmale:

- Relaisausgänge: 3 Sicherheitskontakte (Schließer) und ein Hilfskontakt (Öffner), zwangsgeführt
- Anschlußmöglichkeit für NOT-AUS-Taster, Schutztürgrenztaster und Starttaster
- Statusanzeige
- Überwachung externer Schütze möglich
- Halbleiterausgang meldet Betriebsbereitschaft

Das Schaltgerät erfüllt folgende Sicherheitsanforderungen:

- Schaltung ist redundant mit Selbstüberwachung aufgebaut (EN 954-1 Kategorie 4).
- Sicherheitseinrichtung bleibt auch bei Ausfall eines Bauteils wirksam.
- Bei jedem Ein-Aus-Zyklus der Maschine wird automatisch überprüft, ob die Relais der Sicherheitseinrichtung richtig öffnen und schließen.
- Das Gerät hat eine elektronische Sicherung.

Description

The Safety Relay PNOZ X3P is enclosed in a 45 mm P-99 housing. The unit can be operated with 24 ... 240 VAC/DC.
Features:

- Relay outputs: 3 safety contacts (N/O) and one auxiliary contact (N/C), positive-guided
- Connections for Emergency Stop Button, Safety Gate Limit Switch and Reset button
- Status Indicators
- Monitoring of external contactors/relays possible
- Semi-conductor outputs show ready for operation

The relay complies with the following safety requirements:

- The circuit is redundant with built-in self-monitoring (EN 954-1 Category 4).
- The safety function remains effective in the case of a component failure.
- The correct opening and closing of the safety function relays is tested automatically in each on-off cycle.
- The relays has an electronic fuse.

Description de l'appareil

Inséré dans un boîtier P-99, le bloc logique de sécurité PNOZ X3P peut être alimenté en 24 ... 240 VAC/DC.
Particularités :

- Sorties disponibles : 3 contacts à fermeture de sécurité et un contact à ouverture pour signalisation
- Bornes de raccordement pour poussoirs AU, détecteurs de position et poussoir de validation
- LEDs de visualisation
- Auto-contrôle possible des contacteurs externes
- Sorties statique d'information (relais en position travail)

Le relais PNOZ X3P répond aux exigences suivantes :

- conception redondante avec auto-surveillance (selon EN 954-1 cat. 4)
- sécurité garantie même en cas de défaillance d'un composant
- test cyclique (ouverture/fermeture des relais internes) à chaque cycle Marche/ Arrêt de la machine
- Le relais dispose d'un fusible électronique.

Funktionsbeschreibung

Das Schaltgerät PNOZ X3P dient dem sicherheitsgerichteten Unterbrechen eines Sicherheitsstromkreises. Nach Anlegen der Versorgungsspannung leuchtet die LED "Power". Das Gerät ist betriebsbereit, wenn der Startkreis S13-S14 geschlossen ist oder ein Startkontakt an S33-S34 geöffnet und wieder geschlossen wurde.

- Eingangskreis geschlossen (z. B. NOT-AUS-Taster nicht betätigt):
  Relais K1 und K2 gehen in Wirkstellung und halten sich selbst. Die Statusanzeigen für "CH. 1" und "CH. 2" leuchten. Die Sicherheitskontakte (13-14/23-24/33-34) sind geschlossen, der Hilfskontakt (41-42) ist geöffnet.
- Eingangskreis wird geöffnet (z. B. NOT-AUS-Taster betätigt):
  Relais K1 und K2 fallen in die Ruhestellung zurück. Die Statusanzeige für "CH. 1" und "CH. 2" erlischt. Die Sicherheitskontakte (13-14/23-24/33-34) werden redundant geöffnet, der Hilfskontakt (41-42) geschlossen.

Halbleiterausgang

Der Halbleiterausgang Y32 leitet, wenn die Relais K1 und K2 in Wirkstellung sind. Er sperrt, wenn die Relais in Ruhestellung sind.

Function Description

The relay PNOZ X3P provides a safety-oriented interruption of a safety circuit. When the operating voltage is supplied the LED "Power" is illuminated. The unit is ready for operation, when the reset circuit S13-S14 is closed or a reset contact at S33-S34 was opened and closed again.

- Input Circuit closed (e.g. the Emergency Stop button is not pressed):
  Relays K1and K2 energise and retain themselves. The status indicators for "CH. 1" and "CH. 2" illuminate. The safety contacts (13-14/23-24/33-34) are closed, the auxiliary contact (41-42) is open.
- Input Circuit is opened (e.g. Emergency Stop is pressed)
  Relays K1 and K2 de-energise. The status indicators for "CH.1" and "CH.2" go out. The safety contacts (13-14/23-24/33-34) will be opened (redundant), the auxiliary contact (41-42) closes.

Semi-conductor output

The semi-conductor Y32 conducts if the relays K1 and K2 are energised. Y32 switches off when the relays de-energise to rest position.

Description du fonctionnement

"Power" s'allume. Le relais est activé si le circuit de réarmement S13-S14 est fermé ou si le contact de réarmement sur S33-S34 a été ouvert puis refermé.

- Circuits d'entrée fermés (poussoir AU non actionné) :
  Les relais K1 et K2 passent en position travail et s'auto-maintiennent. Les LEDs "CH.1" et CH.2" s'allument. Les contacts de sécurité (13-14/23-24/33-34) sont fermés et le contact d'info. (41-42) est ouvert.
- Circuits d'entrée ouverts (poussoir AU actionné) :
  Les relais K1 et K2 retombent. Les LEDs "CH.1" et "CH.2" s'éteingnent. Les contacts de sécurité (13-14/23-24/33-34) s'ouvrent et le contact d'info. (41-42) se ferme.

Sortie statique

La sortie statique Y32 est passante si les relais K1 et K2 sont en position travail. Elle est bloquée si les relais sont en position repos.

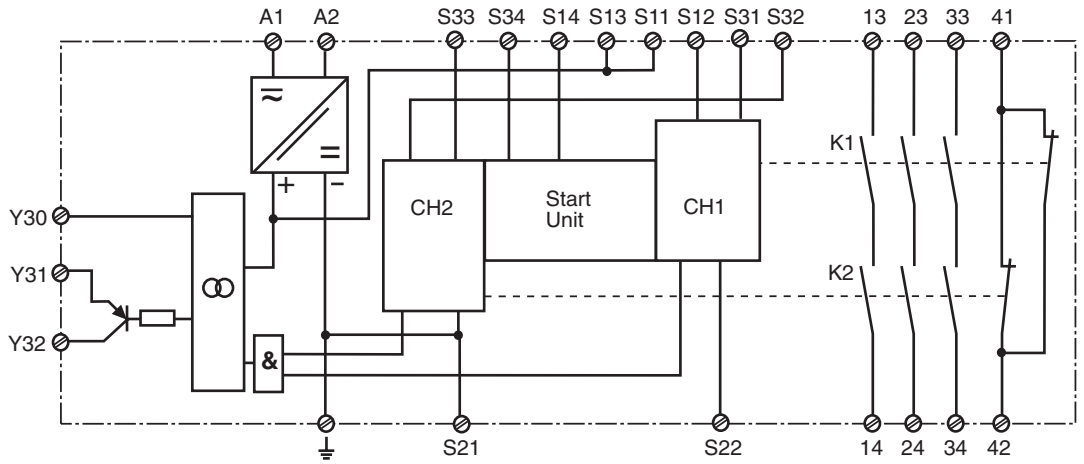

Fig. 1: Innenschaltbild/Internal Wiring Diagram/Schéma de principe

Betriebsarten:

- Einkanaliger Betrieb: Eingangsbeschaltung nach VDE 0113-1 und EN 60204-1, keine Redundanz im Eingangskreis, Erdschlüsse im Tasterkreis werden erkannt.
- Zweikanaliger Betrieb: Redundanter Eingangskreis, Erdschlüsse im Tasterkreis und Querschlüsse zwischen den Tasterkontakten werden erkannt.
- Automatischer Start: Gerät ist aktiv, sobald der Eingangskreis geschlossen ist.
- Manueller Start mit Überwachung: Gerät ist nur aktiv, wenn vor dem Schließen des Eingangskreises der Startkreis geöffnet wird und mindestens 300 ms nach dem Schließen des Eingangskreises der Startkreis geschlossen wird.
- Kontaktvervielfachung und -verstärkung durch Anschluß von externen Schützen

Operating Modes

- Single-channel operation: Input wiring according to VDE 0113-1 and EN 60204-1, no redundancy in the input circuit. Earth faults are detected in the emergency stop circuit.
- Two-channel operation: Redundancy in the input circuit. Earth faults in the Emergency Stop circuit and shorts across the emergency stop push button are also detected.
- Automatic reset: Unit is active as soon as the input circuit is closed.
- Manual reset with monitoring: The unit is only active if, the reset circuit is opened before closing the safety input circuit and then the reset circuit is closed at least 300 ms after closing the safety input circuit.
- Increase in the number of available contacts by connection of external contactors/relays.

Modes de fonctionnement

- Commande par 1 canal : conforme aux prescriptions de la EN 60204/1, pas de redondance dans le circuit d'entrée. La mise à la terre du circuit d'entrée est détectée
- Commande par 2 canaux: circuit d'entrée redondant. La mise à la terre et les courts-circuits entre les contacts sont détectés.
- Réarmement automatique : le relais est activé dès la fermeture des canaux d'entrée.
- Réarmement manuel auto-contrôlé: le relais n'est réarmé que si le circuit de réarmement est ouvert avant la fermeture du circuit d'entrée, puis refermé au min. 300 ms après la fermeture du circuit d'entrée.
- Augmentation du nombre de contacts ou du pouvoir de coupure par l'utilisation de contacteurs externes.

Montage

Das Sicherheitsschaltgerät muß in einen Schaltschrank mit einer Schutzart von mind. IP54 eingebaut werden. Zur Befestigung auf einer Normschiene dient ein Rastelement auf der Rückseite des Geräts.

Installation

The safety relay must be panel mounted (min. IP54). There is a notch on the rear of the unit for DIN-Rail attachment.

Montage

Le relais doit être monté en armoire ayant un indice de protection mini IP54. Sa face arrière permet un montage sur rail DIN.

Inbetriebnahme

Beachten Sie bei der Inbetriebnahme

- Auslieferungszustand: Brücke zwischen S11-S12 (Eingangskreis zweikanalig)
- Nur die Ausgangskontakte 13-14/23-24/33-34 sind Sicherheitskontakte. Ausgangskontakt 41-42 ist ein Hilfskontakt (z. B. für Anzeige).
- **Vor die Ausgangskontakte eine Sicherung (s. techn. Daten) schalten, um das Verschweißen der Kontakte zu verhindern.**
- Berechnung der max. Leitungslänge I_{max}:

$$I_{max} = \frac{R_{lmax}}{R_l / km}$$

R_{lmax} = max. Gesamtleitungswiderstand (s. technische Daten)
R_l /km = Leitungswiderstand/km

Da die Funktion Querschlußerkennung nicht einfehlersicher ist, wird sie von Pilz während der Endkontrolle geprüft. Eine Überprüfung nach der Installation des Geräts ist wie folgt möglich:
1. Gerät betriebsbereit (Ausgangskontakte geschlossen)
2. Die Testklemmen S22-S32 zur Querschlußprüfung kurzschließen.
3. Die Sicherung im Gerät muß auslösen und die Ausgangskontakte öffnen. Leitungslängen in der Größenordnung der Maximallänge können das Auslösen der Sicherung um bis zu 2 Minuten verzögern.
4. Sicherung wieder zurücksetzen: den Kurzschluß entfernen und die Betriebsspannung für ca. 1 Minute abschalten.

- Leitungsmaterial aus Kupferdraht mit einer Temperaturbeständigkeit von 60/75 °C verwenden.
- Angaben im Kapitel „Technische Daten“ unbedingt einhalten.

Ablauf:

- Versorgungsspannung:
  Versorgungsspannung an Klemmen A1 und A2 anlegen.
- Startkreis:
  - Automatischer Start: S13-S14 brücken.
  - Manueller Start mit Überwachung: Taster an S33-S34 anschließen (S13-S14 offen).
- Eingangskreis:
  - Einkanalig: S21-S22 und S31-S32 brücken. Öffnerkontakt von Auslöseelement an S11 und S12 anschließen.
  - Zweikanalig ohne Querschlußerkennung: S21-S22 brücken. Öffnerkontakt von Auslöseelement an S11-S12 und S11-S32 anschließen.
  - Zweikanalig mit Querschlusserkennung: S11-S12 brücken. Öffnerkontakt von Auslöseelement an S21-S22 und S31-S32 anschließen.
- Rückführkreis:
  Externe Schütze in Reihe zu Startkreis S13-S14 bzw. S33-S34 anschließen.
- 24 V Versorgungsspannung für Halbleiterausgang: +24 V DC an Klemme Y31 und 0 V an Klemme Y30 anschließen.

Die Sicherheitskontakte sind aktiviert (geschlossen) und der Hilfskontakt 41-42 ist geöffnet. Die Statusanzeige für "CH.1", "CH. 2", leuchten. Das Gerät ist betriebsbereit. Wird der Eingangskreis geöffnet, öffnen die Sicherheitskontakte 13-14/23-24/33-34 und der Hilfskontakt 41-42 schließt. Die Statusanzeige erlischt.

Operation

Please note for operation:

- Unit delivered with a bridge between S11-S12 (2-channel input circuit)
- Only the output contacts 13-14/23-24/33-34 are safety contacts. Output contact 41-42 is an auxiliary contact (e.g. for a display).
- **To prevent a welding together of the contacts, a fuse (see technical detail) must be connected before the output contacts.**
- Calculate the max. Cable runs I_{max}:

$$I_{max} = \frac{R_{lmax}}{R_l / km}$$

R_{lmax} = max. overall cable resistance (see Technical details)
R_l /km = Cable resistance/km

As the function for detecting shorts across the inputs is not failsafe, it is tested by Pilz during the final control check. However, a test is possible after installing the unit and it can be carried out as follows:
1. Unit ready for operation (output contacts closed)
2. Short circuit the test (connection) terminals S22-S32 for detecting shorts across the inputs.
3. The unit‘s fuse must be triggered and the output contacts must open. Cable lengths in the scale of the maximum length can delay the fuse triggering for up to 2 minutes.
4. Reset the fuse: remove the short circuit and switch off the operating voltage for approx. 1 minute.

- Use copper wiring that will withstand 60/75 °C.
- Important details in the section "Technical Data“ should be noted and adhered to.

To operate:

- Supply operating voltage
  Connect the operating voltage to terminals A1 and A2.
  - Reset circuit:
  - Automatic reset: Bridge S13-S14.
  - Manual reset with monitoring: Connect button to S33-S34 (S13-S14 open).
- Input circuit:
  - Single-channel: Bridge S21-S22 and S31-S32. Connect N/C contact from safety switch (e.g. Emergency-Stop) to S12 and S11.
  - Dual-channel, without short circuit detection: Link S21-S22. Connect N/C contact from safety switch (e.g. emergency stop) to S11-S12 and S11-S32
  - Dual-channel, with short circuit detection: Bridge S11-S12. Connect N/C contact from safety switch (e.g. emergency-stop) to S21-S22 and S31-S32.
- Feedback control loop:
  Connect external relays/contactors in series to reset circuit S13-S14 or S33-S34.
- 24 VDC supply voltage for semi-conductor output: Connect +24 VDC to terminals Y31 and 0 VDC to Y30.

The safety contacts are activated (closed) and the auxiliary contact (41-42) is open. The status indicators "CH.1"and "CH.2" are illuminated. The unit is ready for operation. If the input circuit is opened, the safety contacts 13-14/23-24, 33-34 open and the auxiliary contact 41-42 closes. The status indicator goes out.

Mise en oeuvre

Remarques préliminaires :

- Pontages présents à la livraison: S11-S12 (commande par 2 canaux)
- Seuls les contacts 13-14, 23-24, 33-34 sont des contacts de sécurité. Le contact 41-42 est un contact d’information (ex. voyant)
- **Raccordez une fusible (voir les caractéristiques techniques) avant les contacts de sortie afin d'éliminer tout risque de fusion.**
- Calculer les longueurs de câblage max I_{max} dans le circuit d’entrée:

$$I_{max} = \frac{R_{lmax}}{R_l / km}$$

R_{lmax} = Résistivité de câblage totale max. (voir les caractéristiques techniques)
R_l /km = résistivité de câblage/km

La fonction de détection de court-circuit est testé par Pilz lors du contrôle final. Un test sur site est possible de la façon suivante :
1. Appareil en fonction (contacts de sortie fermés)
2. Court-circuiter les bornes de raccordement nécessaires au test S22-S32.
3. Le fusible interne du relais doit déclencher et les contacts de sortie doivent s‘ouvrir. Le temps de réponse du fuisible peut aller jusqu‘à 2 min. si les longueurs de câblage sont proches des valeurs maximales.
4. Réarmement du fusible : enlever le court-circuit et couper l‘alimentation du relais pendant au moins 1 min.

- Utiliser uniquement des fils de cablâge en cuivre 60/75 °C.
- Respecter les données indiquées dans le chap. „Caractéristiques techniques“.

Mise en oeuvre :

- Tension d’alimentation
  amener la tension d’alimentation sur A1 et A2.
- Circuit de réarmement:
  - réarmement automatique: pontage des bornes S13-S14
  - réarmement manuel auto-côntrolé: câblage d'un poussoir sur S33-S34 (S13-S14 ouvert).
- Circuits d’entrée:
  - Commande par 1 canal : câblage du contact à ouverture entre S11-S12, pontage entre S21-S22 et S31-S32
  - Commande par 2 canaux sans détection des courts-circuits: câblage des contacts à ouverture entre S11-S12, S11-S32, pontage entre S21-S22
  - Commande par 2 canaux avec détection des courts-circuits: câblage des contacts à ouverture entre S21-S22 et S31-S32, pontage entre S11-S12
- Boucle de retour:
  câbler les contacts des contacteurs externes en série dans le circuit de réarmement S13-S14 ou S33-S34.
- Alimentation en 24 VCC de sortie statique: relier le +24 V DC à la borne Y31 et le 0 V à la borne Y30.

Les contacts de sécurité se ferment et le contact d’information 41-42 s’ouvre. Les LEDs "CH.1"et "CH.2" sont allumées. L’appareil est prêt à fonctionner.
Si le circuit d’entrée est ouvert, les contacts de sécurité retombent et le contact d’information 41-42 se ferme. Les LEDs s’éteignent.

Wieder aktivieren
- Eingangskreis schließen.
- Bei manuellem Start mit Überwachung Taster zwischen S33 und S34 betätigen.

Die Statusanzeigen leuchten wieder, der Eingangskreis ist aktiviert.

Reactivation
- Close the input circuit.
- For manual reset with monitoring, press the button between S33-S34.

The status indicators illuminate once more, the input circuit is activated.

Remise en route :
- fermer le circuit d'entrée.
- en cas de surveillance du circuit de réarmement, appuyer le poussoir de validation S33-S34.

Les LEDs sont à nouveau allumées. Les contacts de sortie sont fermées.

Anwendung

In Fig. 2 ... Fig. 10 sind Anschlußbeispiele für NOT-AUS-Beschaltung mit automatischem und überwachtem Start, Schutztüransteuerungen sowie Kontaktvervielfachung durch externe Schütze.
Bitte beachten Sie:
- Fig. 2 und 7: **keine** Verbindung S33-S34
- Fig. 3, 4, 5, 6, 8: **keine** Verbindung S13-S14
- Fig. 7: Automatischer Start bei Schutztürsteuerung: Das Gerät ist bei geöffneter Schutztür über den Startkreis S13-S14 startbereit. Nach Schließen der Eingangskreise S11-S12, S21-S22 und S31-S32 werden die Sicherheitskontakte geschlossen.

Beachten Sie bei Fig. 2 und 7: Das Gerät startet bei Spannungsausfall und -wiederkehr automatisch. Verhindern Sie einen unerwarteten Wiederanlauf durch externe Schaltungsmaßnahmen.

Application

In Fig. 2 ...Fig. 10 are connection examples for Emergency Stop wiring with automatic and monitored reset. Safety gate controls as well as contact expansion via external contactors.
- Fig. 2 and 7: S33-S34 **not** connected
- Fig. 3, 4, 5, 6, 8: S13-S14 **not** connected
- Fig. 7: Automatic reset with safety gate control: with the safety gate open the unit is ready for operation via reset circuit S13-S14. After closing the safety input circuit S11-S12, S21, S22 and S31-S32 the safety contacts will close.

Please note for Fig. 2 and 7: the device starts automatically after loss of power. You should prevent an unintended start-up by using external circuitry measures.

Utilisation

Les figures 2 à 10 représentent les différents câblages possibles du PNOZ X3P à savoir : poussoir AU avec réarmement automatique ou auto-côntrolé, interrupteurs de position et augmentation du nombre des contacts de sécurité par contacteurs externes.
- Fig. 2 et 7: **pas** de câblage sur S33-S34
- Fig. 3, 4, 5, 6, 8: **pas** de câblage sur S13-S14
- Fig. 7: Réarmement automatique en cas de surveillance protecteur: lorsque le protecteur est ouvert, le circuit S13-S14 se ferme et le relais est prêt à fonctionner. Dès la fermeture des canaux d'entrée S11-S12, S21-S22 et S31-S32, les contacts de sortie du relais se ferment.

Dans le cas de la figure 2 et 7, l'appareil se réarme automatiquement après une coupure et une remise sous tension. Evitez tout risque de redémarrage par un câblage externe approprié.

Fehler - Störungen

- Erdschluß bei PNOZ X3P: Eine elektronische Sicherung bewirkt das Öffnen der Ausgangskontakte bei Fehlströmen ≥1,2 A. Nach Wegfall der Störungsursache und Abschalten der Versorgungsspannung für ca. 1 min ist das Gerät wieder betriebsbereit.
- Fehlfunktionen der Kontakte: Bei verschweißten Kontakten ist nach Öffnen des Eingangskreises keine neue Aktivierung möglich.
- LED "Power" leuchtet nicht: Kurzschluß oder Versorgungsspannung fehlt.

Faults

- Earth fault on PNOZ X3P: An electronic fuse causes the output contacts to open with fault currents ≥ 1.2 A. Once the cause of the fault has been removed and operating voltage is switched off, the unit will be ready for operation after approximately 1 minute.
- Contact failure: In the case of welded contacts, no further activation is possible following an opening of the input circuit.
- LED "Power" is not illuminated if short-circuit or the supply voltage is lost.

Erreurs - Défaillances

- Défaut de masse du PNOZ X3P: un fusible électronique entraîne l'ouverture des contacts de sortie si l'intensité est ≥ à 1,2 A. Une fois la cause du défaut éliminée et la tension d'alimentation coupée, l'appareil est à nouveau prêt à fonctionner après environ 1 minute.
- Défaut de fonctionnement des contacts de sortie: en cas de soudage d'un contact lors de l'ouverture du circuit d'entrée, un nouvel réarmement est impossible.
- LED "Power" éteinte: tension d'alimentation non présente ou court-circuit interne.

Max. Dauerstrom bei gleichzeitiger Belastung mehrerer Kontakte/Total current switching capability across all contacts/Intensité commutée max. en cas de charge sur plusieurs contacts (AC1, DC1)

Anzahl der Kontakte/number of contacts/nombre des contacts	3	2	1
Imax (A) pro Kontakt bei Versorgungsspannung AC/per contact with operating voltage AC/par contact pour tension d'alimentation AC	6,0	7,0	8,0
Imax (A) pro Kontakt bei Versorgungsspannung DC/per contact with operating voltage DC/par contact pour tension d'alimentation DC	6,0	7,0	8,0

Um ein Versagen der Geräte zu verhindern, an allen Ausgangskontakten für eine ausreichende Funkenlöschung sorgen. Bei kapazitiven Lasten sind eventuell auftretende Stromspitzen zu beachten. Bei DC-Schützen Freilaufdioden zur Funkenlöschung einsetzen, um die Lebendauer der Schütze zu erhöhen.

To prevent failure of the unit, all output contacts should be fused adequately. With capacative loads, possible current peaks are to be avoided. With DC contactors/relays use suitable spark suppression to ensure extended life of the contactors/relays.

Prévoir un dispositif d'extinction d'arc sur les contacts de sortie pour éviter un éventuel disfonctionnement du relais.
Tenir compte des pointes d'intensité en cas de charge capacitive. Equiper les contacteurs DC de diodes de roue libre .

Lebensdauer der Ausgangsrelais/Service Life of Output relays/Durée de vie des relais de sortie

- **E Instrucciones de uso**
- **I Istruzioni per l`uso**
- **NL Gebruiksaanwijzing**

⚠ Normas de seguridad

- El dispositivo debe ser instalado y puesto en funcionamiento sólo por personas que tengan experiencia con estas instrucciones de uso y con las normativas de seguridad del trabajo y prevención de accidentes vigentes. Tenga en cuenta las normativas VDE, como también las normativas locales, especialmente en lo concerniente a medidas de protección.
- Respetar las exigencias de la norma EN 60068-2-6 referente al transporte, almacenaje y utilización del dispositivo (v. datos técnicos).
- Por apertura de la carcasa o modificaciones arbitrarias, caduca cualquier tipo de garantía.
- Instale el dispositivo en un armario de distribución; polvo y humedad pueden conducir, de lo contrario, a una merma de las funciones.
- Procúrese una conexión de protección adecuada, en todos los contactos de salida sometidos a cargas capacitivas e inductivas.
- La función de seguridad debe ejecutarse por lo menos una vez al mes.

Aplicación correcta

El dispositivo de seguridad PNOZ X3P está destinado para ser usado en

- Dispositivos para parada de emergencia
- Circuitos eléctricos de seguridad según VDE 0113-1 y EN 60204-1 (p. ej,. para cubiertas móviles)

Descripción del dispositivo

El dispositivo de seguridad PNOZ X3P está alojado en una carcasa P-99. Se puede hacer funcionar con tensión de corriente contínua o alterna de 24 ... 240 V.
Características:

- Salidas de relés: 3 contactos de seguridad (normalmente abierto) y un contacto auxiliar (normalmente cerrado), de guía forzosa
- Opción de conexión para pulsador de parada de emergencia, final de carrera de seguridad de puerta protectora y pulsador de rearme
- Indicador de estado
- Posibilidad de supervisión de contactores externos
- La salida de semiconductor comunica disposición para el funcionamiento

El dispositivo cumple los siguientes requisitos de seguridad:

- Concepción redundante con autosupervisión (EN 954-1, categoría 4).
- El dispositivo de seguridad permanece activo aún cuando falle un componente.
- En cada ciclo de marcha/parada de la máquina, se verifica automáticamente, si los relés del dispositivo de seguridad abren y cierran correctamente.
- El dispositivo tiene un fusible electrónico.

⚠ Norme di sicurezza

- Il dispositivo deve essere installato e messo in funzione solo da persone a conoscenza delle presenti istruzioni per l'uso e delle norme antinfortunistiche e di sicurezza del lavoro vigenti. Si devono inoltre rispettare le norme VDE, nonché le norme locali, soprattutto per quanto riguarda gli interventi di sicurezza.
- Per il trasporto, l'immagazzinamento ed il funzionamento, rispettare le norme EN 60068-2-6 (vedere i dati tecnici).
- In caso di apertura della custodia o di modifiche non autorizzate, non sarà riconosciuta alcuna garanzia.
- Montare il dispositivo in un armadio elettrico, perché la polvere e l'umidità potrebbero comprometterne il funzionamento.
- In caso di carichi capacitivi ed induttivi, assicurareuna adeguata protezione per tutti i contatti di uscita.
- La funzione di sicurezza deve essere attivata almeno una volta al mese.

Uso previsto

Il modulo di sicurezza PNOZ X3P è previsto per l'impiego nei

- Dispositivi di arresto di emergenza
- Circuiti elettrici di sicurezza secondo VDE 0113-1 ed EN 60204-1 (per es. per ripari mobili)

Descrizione del dispositivo

Il dispsositivo di sicurezza PNOZ X3P è inserito in una custodia P-99. Il dispositivo può funzionare con tensione continua, oppure con tensione alternata di 24 ... 240 V.
Caratteristiche:

- Uscite relè: 3 contatti di sicurezza (NA) ed un contatto ausiliario (contatto NC), a conduzione forzata
- Possibilità di collegamento per pulsanti di arresto di emergenza, finecorsa riparo mobile e pulsante di start
- LED di stato
- Possibilità di controllo dei relè esterni
- L'uscita a semiconduttore segnala il funzionamento

Il dispositivo elettrico è conforme ai seguenti requisiti di sicurezza:

- Concezione ridondante con autocontrollo (EN 954-1, categoria 4).
- Il dispositivo mantiene la sua funzione di sicurezza anche in caso di avaria di un componente.
- Ad ogni ciclo di inserimento-disinseri-mento della macchina, viene controllato automaticamente se i relè del dispositivo di sicurezza aprono e chiudono correttamente.
- Il dispositivo è dotato di un fusibile elettronico.

⚠ Veiligheidsvoorschriften

- Het apparaat mag uitsluitend worden geïnstalleerd en in bedrijf genomen door personen die vertrouwd zijn met deze gebruiksaanwijzing en met de geldende voorschriften op het gebied van arbeidsveiligheid en ongevallenpreventie. Neemt u de van toepassing zijnde Europese richtlijnen en de plaatselijke voorschriften in acht, in het bijzonder m.b.t. veiligheidsmaatregelen.
- Neemt u bij transport, opslag en in bedrijf de richtlijnen volgens EN 60068-2-6 in acht (zie technische gegevens).
- Het openen van de behuizing of het eigenmachtig veranderen van de schakeling heeft verlies van de garantie tot gevolg.
- Monteert u het apparaat in een schakelkast. Stof en vochtigheid kunnen anders de werking nadelig beïnvloeden.
- Zorgt u bij capacitieve of inductieve belasting van de uitgangscontacten voor adequate contactbeschermings-maatregelen.
- De veiligheidsfunctie moet ten minste een keer per maand geactiveerd worden.

Toegelaten applicaties

Het veiligheidsrelais PNOZ X3P is bestemd voor gebruik in

- noodstopvoorzieningen
- veiligheidscircuits volgens VDE 0113-1 en EN 60204-1
  (b.v. bij beweegbare afschermingen)

Apparaatbeschrijving

Het veiligheidsrelais PNOZ X3P is in een P-99-behuizing ondergebracht. Het kan met 24 ... 240 V gelijkspanning of wisselspanning gebruikt worden.
Kenmerken:

- Relaisuitgangen: 3 veiligheidscontacten (maakcontacten) en 1 hulpcontact (verbreekcontact), mechanisch gedwongen
- Aansluitmogelijkheid voor noodstop-knoppen, deurcontacten en de startknop
- Status-LED's
- Bewaking van externe magneetschakelaars mogelijk
- Halfgeleideruitgang geeft melding indien bedrijfsklaar

Het relais voldoet aan de volgende veiligheidseisen:

- De schakeling is redundant met zelfcontrole opgebouwd (EN 954-1 categorie 4).
- Ook bij uitvallen van een component blijft de veiligheidsschakeling werken.
- Bij elke aan/uit-cyclus van de machine wordt automatisch getest of de relais-contacten van de veiligheidsvoorziening correct openen en sluiten.
- Het apparaat heeft een elektronische zekering.

Descripción funcional

El dispositivo PNOZ X3P sirve para una interrupción por motivos de seguridad de un circuito eléctrico de seguridad. Después de aplicarse la tensión de alimentación se enciende el LED "Power". El dispositivo está listo para funcionar, cuando el circuito de rearme S13-S14 está cerrado o un contacto de rearme fue abierto y nuevamente cerrado en S33-S34.

- Circuito de entrada cerrado (p. ej., pulsador de parada de emergencia no accionado):
  Los relés K1 y K2 pasan a posición activa y se automantienen. Los indica-dores de estado para "CH.1" y "CH.2" se iluminan. Los contactos de seguridad (13-14/23-24/33-34) están cerrados, el contacto auxiliar (41-42) está abierto.
- Circuito de entrada es abierto (por ej., accionado el pulsador de parada de emergencia):
  Los relés K1 y K2 vuelven a la posición de reposo. Los indicadores de estado "CH.1" y "CH.2" se apagan. Los contactos de seguridad (13-14/23-24/33-34) se abren por redundancia, el contacto auxiliar (41-42) se cierra.

Salida de semiconductor

La salida de semiconductor Y32 conduce, cuando los relés K1 y K2 están en posición activa. Bloquea, cuando los relés están en posición de reposo.

Descrizione del funzionamento

Il dispositivo elettrico PNOZ X3P serve per interrompere in modo sicuro un circuito elettrico di sicurezza. Dopo l'applicazione della tensione di alimentazione si accende il LED «Power». Il dispositivo è pronto per il funzionamento dopo che è stato chiuso il circuito start S13-S14, o dopo che un contatto di start su S33-S34 è stato aperto e nuovamente chiuso.

- Circuito di ingresso chiuso (per es. pulsante di arresto di emergenza non azionato):
  i relè K1 e K2 si attivano automanten-endosi. I LED di stato per «CH.1» e «CH.2» sono accesi. I contatti di sicurezza (13-14/23-24/33-34) sono chiusi, il contatto ausiliario (41-42) è aperto.
- Apertura del circuito di ingresso (per es. in caso di azionamento del pulsante di arresto di emergenza):
  i relè K1 e K2 tornano nella posizione di riposo. I LED di stato per «CH.1» e «CH.2» si spengono. I contatti di sicurezza (13-14/23-24/33-34) vengono aperti in modo ridondante, il contatto ausiliario (41-42) viene chiuso.

Uscita a semiconduttore

L'uscita a semiconduttore Y32 è conducente quando i relè K1 e K2 sono attivati. L'uscita blocca quando i relè sono nella posizione di riposo.

Functiebeschrijving

Het relais type PNOZ X3P dient om een veiligheidscircuit veilig te onderbreken. Na het inschakelen van de voedingsspanning licht de LED „Power" op. Het apparaat is bedrijfsklaar wanneer het startcircuit S13-S14 gesloten is of een startcontact S33-S34 geopend en weer gesloten werd.

- Ingangscircuit gesloten (b.v. noodstopknop niet bediend):
  Relais K1 en K2 worden bekrachtigd en nemen zichzelf over. De status-LED's voor „CH. 1" en „CH. 2" lichten op. De veiligheidscontacten (13-14/23-24/33-34) zijn gesloten, het hulpcontact (41-42) is geopend.
- Ingangscircuit wordt geopend (b.v. noodstopknop bediend):
  Relais K1 en K2 vallen af. De status-LED's voor „CH. 1" en „CH. 2" doven. De veiligheidscontacten (13-14/23-24/33-34) worden redundant geopend, het hulpcontact (41-42) wordt gesloten.

Halfgeleideruitgang

De halfgeleideruitgang Y32 geleidt, als de relais K1 en K2 bekrachtigd zijn. Hij geleidt niet als de relais afgevallen zijn.

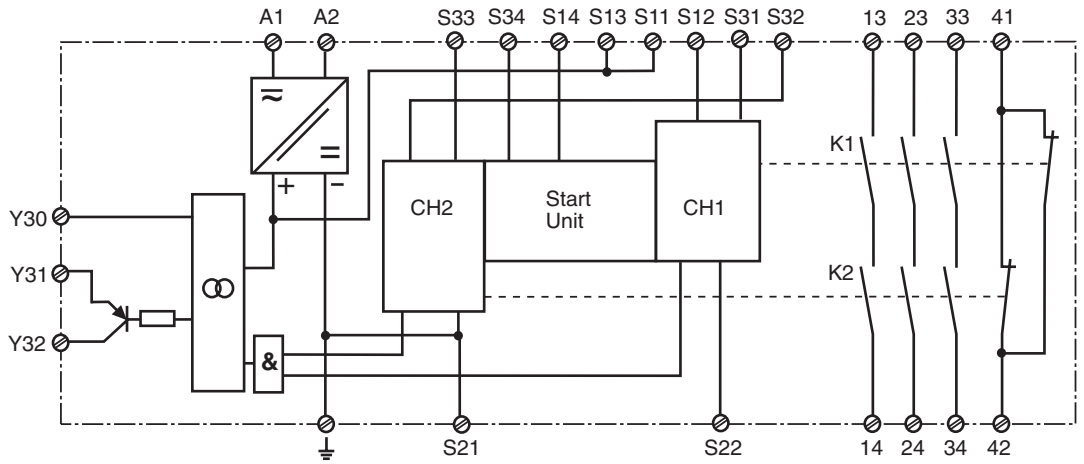

Fig. 1: Esquema de conexiones eléctricas/Schema di collegamento interno/ Intern schema

Modos de funcionamiento:

- Funcionamiento monocanal: Conexión de la entrada según VDE 0113-1 y EN 60204-1, no existe la redundancia en el circuito de entrada, son reconocidos los defectos a tierra en el circuito del pulsador.
- Funcionamiento bicanal: Circuito de entrada redundante, se detectan defectos a tierra en el circuito del pulsador y cortocircuitos transversales entre los contactos del pulsador.
- Rearme automático: El dispositivo se activa tan pronto como se cierra el circuito de entrada.
- Rearme manual con supervisión: El dispositivo se activa, sólo cuando antes del cierre del circuito de entrada, el circuito de rearme es abierto, y cerrado por lo menos 300 ms después del cierre del circuito de entrada.
- Multiplicación y refuerzo de contactos mediante la conexión de contactores externos.

Modalità operative

- Funzionamento monocanale: cablaggio di ingresso secondo VDE 0113-1 e EN 60204-1; senza ridondanza nel circuito di ingresso, le dispersioni verso terra nel circuito del pulsante vengono rilevate.
- Funzionamento bicanale: circuito di ingresso ridondante; vengono rilevate le dispersioni verso terra nel circuito del pulsante, nonché il cortocircuito trasversali tra i contatti del pulsante stesso.
- Start automatico: Il dispositivo è attivo non appena il circuito di ingresso è chiuso.
- Start manuale controllato: il dispositivo è attivo soltanto se prima di chiudere il circuito di ingresso viene aperto il circuito di start e se il circuito di start viene chiuso almeno 300 ms dopo la chiusura del circuito di ingresso.
- Aumento del numero e delle portate dei contatti mediante il collegamento di relè esterni.

Bedrijfsmodi:

- Eenkanalig bedrijf: ingangsschakeling volgens VDE 0113-1 en EN 60204-1, geen redundantie in het ingangscircuit, aardsluitingen in het ingangscircuit worden gedetecteerd.
- Tweekanalig bedrijf: redundant ingangs-circuit, aardsluitingen in het ingangscircuit en onderlinge sluitingen tussen de ingangscontacten worden gedetecteerd.
- Automatische start: apparaat is actief, zodra het ingangscircuit gesloten is.
- Handmatige start met bewaking: apparaat is alleen actief, als vóór het sluiten van het ingangscircuit het startcircuit geopend wordt en minstens 300 ms na het sluiten van het ingangscircuit het startcircuit gesloten wordt.
- Contactvermeerdering en -versterking door aansluiten van externe magneetschakelaars.

Montaje

El dispositivo de seguridad debe montarse en un armario de distribución con un grado de protección de por lo menos IP54. Para fijación sobre una guía normalizada sirve un elemento de enclavamiento en la parte posterior del dispositivo.

Puesta en marcha

Tenga en cuenta durante la puesta en marcha:

- Estado de entrega: Puente entre S11-S12 (circuito de entrada bicanal)
- Solamente los contactos de salida 13-14/ 23-24/33-34 son contactos de seguridad. El contacto de salida 41-42 es un contacto auxiliar (por ej., para indicador).
- **Para evitar contactos soldados por sobrecalentamiento, conectar un fusible (véanse datos técnicos) antes de los contactos de salida.**
- Cálculo de la longitud máxima de línea $I_{máx}$:

$$I_{max} = \frac{R_{lmax}}{R_l / km}$$

$R_{lmáx}$ = resistencia máx. del total de la línea (véanse datos técnicos)
R_l /km = resistencia de línea/km

Ya que la función detección de cortocircuito transversal no es libre de errores, es probada por Pilz en el control final. Una verificación después de la instalación del dispositivo es posible de la siguiente forma:
1º El dispositivo debe estar preparado para funcionar (contactos de salida cerrados).
2º Poner en cortocircuito los bornes de prueba S22-S32 para verificar el cortocircuito transversal.
3º El fusible en el dispositivo se debe disparar y los contactos de salida se abren. Longitudes de línea en el orden de la longitud máxima, pueden retardar el disparo del fusible en hasta 2 minutos.
4º Reponer nuevamente el fusible: retirar el cortocircuito y desconectar la tensión de funcionamiento por aprox. 1 minuto.

- Emplear sólo conductores de cobre con resistencia a la temperatura de 60/75 °C.
- Respetar necesariamente las indicaciones del capítulo “Datos Técnicos”.

Desarrollo:

- Tensión de alimentación:
  Aplicar la tensión de alimentación en los bornes A1 y A2.
- Circuito de rearme:
  - Rearme automático: Puentear S13-S14.
  - Rearme manual con supervisión: Conectar un pulsador entre S33-S34 (S13-S14 abiertos).
- Circuito de entrada:
  - Monocanal: Puentear S21-S22 y S31-S32. Conectar en S11 y S12 el contacto normalmente cerrado del elemento disparador.
  - Bicanal sin detección de cortocircuito transversal: Puentear S21-S22. Conectar el contacto normalmente cerrado del elemento disparador en S11-S12 y S11-S32.
  - Bicanal con detección de cortocircuito transversal: Puentear S11-S12. Conectar el contacto normalmente cerrado del elemento disparador en S21-S22 y S31-S32.

Montaggio

Il dispsositivo di sicurezza deve essere montato in un armadio elettrico con un grado di protezione di min. IP54. Per il fissaggio su una guida DIN è previsto un elemento di blocco sul lato posteriore del dispositivo.

Messa in funzione

Per la messa in funzione rispettare quanto segue:

- Stato alla consegna: ponticello tra S11-S12 (circuito di ingresso bicanale)
- Solo i contatti di uscita 13-14/23-24/33-34 sono dei contatti di sicurezza. Il contatto di uscita 41-42 è un contatto ausiliario (per es. per segnalazione).
- **A monte dei contatti di uscita si deve collegare un fusibile (v. Dati Tecnici) per impedire la saldatura tra i contatti stessi.**
- Calcolo lunghezza massima del conduttore I_{max}:

$$I_{max} = \frac{R_{lmax}}{R_l / km}$$

R_{lmax} = resistenza max. totale del conduttore (v. Dati tecnici)
R_l /km = resistenza del conduttore/km

Poiché la funzione di rilevamento del cortocircuito non è protetto da errori, esso viene controllata dalla Pilz durante il collaudo finale. Una verifica dopo l’installazione del dispositivo può essere eseguita nel modo seguente:
1. Dispositivo pronto per il funzionamento (contatti di uscita chiusi)
2. Cortocircuitare i morsetti di test S22-S32 per il controllo dei cortocircuiti.
3. Il fusibile nel dispositivo deve scattare ed i contatti di uscita si devono aprire. I cavi di massima lunghezza possono ritardare la commutazione del fusibile fino a 2 minuti.
4. Ripristinare il fusibile: eliminare il cortocircuito e disinserire per ca. 1 min la tensione di alimentazione.

- Usare conduttori di rame con una resistenza termica di 60/75 °C.
- Rispettare assolutamente le indicazioni riportate nel capitolo «Dati tecnici».

Procedura:

- Tensione di alimentazione:
  Applicare la tensione di alimentazione ai morsetti A1 e A2.
- Circuito di start:
  - Start automatico: ponticellare S13-S14.
  - Start manuale controllato: collegare il pulsante a S33-S34 (S13-S14 aperto)
- Circuito di ingresso:
  - Monocanale: ponticellare S21-S22 e S31-S32. Collegare il contatto NC a S11 e S12.
  - Bicanale senza rilevamento del cortocircuito trasversale: ponticellare S21-S22. Collegare il contatto NC a S11-S12 e S11-S32.
  - Bicanale con rilevamento cortocircuito trasversale: ponticellare S11-S12. Collegare il contatto NC a S21-S22 e S31-S32.

Montage

Het veiligheidsrelais moet ingebouwd worden in een schakelkast die minimaal voldoet aan beschermingsgraad IP54. Bevestiging op een DIN-rail is mogelijk via de daarvoor bestemde relaisvoet op de achterzijde van het apparaat.

Ingebruikname

Neemt u bij ingebruikname het volgende in acht:

- Toestand bij levering: brug tussen S11-S12 (tweekanalig ingangscircuit)
- Alleen de uitgangscontacten 13-14/23-24/ 33-34 zijn veiligheidscontacten. Uitgangscontact 41-42 is een hulpcontact (b.v. voor signalering).
- **Uitgangscontacten afzekeren (zie technische gegevens) om het verkleven van de contacten te voorkomen.**
- Berekening van de max. kabellengte I_{max}:

$$I_{max} = \frac{R_{lmax}}{R_l / km}$$

R_{lmax} = max. weerstand totale kabel (zie technische gegevens)
R_l /km = kabelweerstand/km

Omdat de functie detectie van onderlinge sluiting niet enkelfoutveilig is, wordt deze door Pilz tijdens de eindcontrole getest. Een controle na de installatie van het apparaat is als volgt mogelijk:
1. Apparaat bedrijfsklaar (uitgangscontacten gesloten)
2. De testklemmen S22-S32 kortsluiten om de detectie van onderlinge sluiting te testen.
3. De zekering in het apparaat moet geactiveerd worden en de uitgangscontacten moeten opengaan. Kabellengten van ongeveer de maximale lengte kunnen het activeren van de zekering met max. 2 minuten vertragen.
4. Zekering resetten: de kortsluiting ongedaan maken en de voedingsspanning voor ca. 1 minuut uitschakelen.

- Kabelmateriaal uit koperdraad met een temperatuurbestendigheid van 60/75 °C gebruiken.
- Aanwijzingen in het hoofdstuk “Technische gegevens” beslist opvolgen.

Instelprocedure:

- Voedingsspanning:
  voedingsspanning op klemmen A1 en A2 aansluiten.
- Startcircuit:
  - Automatische start: S13-S14 verbinden.
  - Handmatige start met bewaking: knop op S33-S34 aansluiten (S13-S14 open).
- Ingangscircuit:
  - Eenkanalig: S21 met S22 en S31 met S32 verbinden. Verbreekcontact van bedieningsorgaan op S11 en S12 aansluiten.
  - Tweekanalig zonder detectie van onderlinge sluiting: S21-S22 verbinden. Verbreekcontact van bedieningsorgaan op S11-S12 en S11-S32 aansluiten.
  - Tweekanalig met detectie van onderlinge sluiting: S11-S12 verbinden. Verbreekcontact van bedieningsorgaan op S21-S22 en S31-S32 aansluiten.

- Circuito de realimentación: Conectar contactores externos en serie al circuito de rearme S13-S14 o S33-S34.
- Tensión de alimentación de 24 V para la salida de semicond.: Conectar +24 V DC en el borne Y31 y 0 V en el borne Y30.

Los contactos de seguridad se activan (cerrados) y el contacto auxiliar 41-42 se abre. Se iluminan los indicadores de estado para “CH.1”, “CH. 2”. El dispositivo está listo para funcionar. Al abrirse el circuito de entrada, se abren los contactos de seguridad 13-14/23-24/33-34 y se cierra el contacto auxiliar 41-42. El indicador de estado se apaga.

Reactivación

- Cerrar el circuito de entrada.
- En caso de rearme man. con supervisión, accionar el pulsador entre S33 y S34.

Los indicadores de estado se iluminan nuevamente y se activa el circuito de entrada.

- Circuito di retroazione: Collegare in serie i relè esterni al circuito di start S13-S14 o S33-S34.
- Tensione di alimentazione di 24 V per l’uscita a semiconduttore: Collegare +24 V DC al morsetto Y31 e 0 V al morsetto Y30.

I contatti di sicurezza sono attivati (chiusi) ed il contatto ausiliario 41-42 è aperto. I LED di stato per «CH.1», «CH. 2» sono accesi. Il dispositivo è pronto per il funzionamento. Se viene aperto il circuito di ingresso i contatti di sicurezza 13-14/23-24/33-34 si aprono ed il contatto ausiliare 41-42 si chiude. Il LED di stato si spegne.

Riattivazione

- Chiudere il circuito di ingresso.
- In caso di start manuale controllato, azionare il pulsante tra S33 e S34.

I LED di stato si riaccendono ed il circuito di ingresso è attivato.

- Terugkoppelcircuit: Verbreekcontacten van externe magneetschakelaars in serie met het startcircuit S13-S14 dan wel S33-S34 aansluiten.
- 24 V voedingsspanning voor halfgeleideruitgang: +24 V DC op klem Y31 en 0 V op klem Y30 aansluiten.

De veiligheidscontacten zijn geactiveerd (gesloten) en het hulpcontact 41-42 is geopend. De status-LED’s voor „CH.1“, “CH. 2" lichten op. Het apparaat is bedrijfsklaar. Als het ingangscircuit geopend wordt, gaan de veiligheidscontacten 13-14/23-24/33-34 open en het hulpcontact 41-42 sluit. De status-LED’s doven.

Opnieuw activeren

- Ingangscircuit sluiten.
- Bij handmatige start met bewaking de knop tussen S33 en S34 bedienen.

De status-LED’s lichten weer op, het ingangscircuit is geactiveerd.

Aplicación

En las Fig. 2 ... a Fig. 11 se presentan ejemplos de conexión para modo de conexión de parada de emergencia con rearme automático y manual, control de puerta protectora así como multiplicación de contactos mediante contactores externos.
Por favor tenga en cuenta:

- Fig. 2 y 7: **no hay** conexión S33-S34
  Tenga en cuenta: En caso de caida de tensión y rearranque, el dispositivo se inicia automáticamente. Evite un arranque intempestivo mediante un cableado externo adecuado.
- Fig. 3, 4, 5, 6, 8:
  no hay conexión S13-S14
- Fig. 7: Rearme automático para el control de puerta protectora: El dispositivo está preparado para rearmarse con la puerta de protección abierta por medio del circuito de rearme S13-S14. Después de cerrarse los circuitos de entrada S11-S12, S21-S22 y S31-S32 se cerrarán los contactos de seguridad.

Uso

In Fig. 2 ... Fig. 11 sono riportati degli esempi di collegamento per il cablaggio dell’arresto di emergenza con start automatico e controllato, peril controllo finecorsa di ripari mobili, nonché per l’aumento del numero dei contatti mediante relè esterni.
Nota bene:

- Fig. 2 e 7: **nessun** collegamento S33-S34
  Il dispositivo si avvia automaticamente dopo la caduta ed il ritorno dell’alimentazione. Occorre prevenire un riavvio inatteso usando circuiti esterni di misura
- Fig. 3, 4, 5, 6, 8:
  nessun collegamento S13-S14
- Fig. 7: start automatico per controllo ripari mobili: Con riparo mobile aperto, il dispositivo è pronto per lo start attraverso il circuito di start S13-S14. Dopo la chiusura dei circuiti di ingresso S11-S12, S21-S22 e S31-S32 i contatti di sicurezza vengono chiusi.

Toepassing

In fig. 2 ... fig. 11 worden aansluitvoorbeelden gegeven van noodstopschakeling met automatische en bewaakte start, hekbewaking en contactvermeerdering door middel van externe magneetschakelaars.
Let u a.u.b. op het volgende:

- Fig. 2 en 7: **geen** verbinding S33-S34
  Het apparaat start automatisch bij uitvallen en terugkeren van de spanning. Vermijd een onverwacht heraanlopen door maatregelen in de externe schakeling.
- Fig. 3, 4, 5, 6, 8:
  geen verbinding S13-S14
- Fig. 7: Automatische start bij hekbewaking: Het apparaat is bij geopend hek via het startcircuit S13-S14 startklaar. Na sluiten van de ingangscircuits S11-S12, S21-S22 en S31-S32 worden de veiligheidscontacten gesloten.

S3: Pulsador de rearme/Pulsante di start/Startknop

Defectos - Averías

- Cortocircuito en el circuito de entrada: La tensión de alimentación cae y los contactos de seguridad se abren a través de un fusible electrónico. Una vez haya desaparecido la causa del error y se haya desconectado la tensión de alimentación durante aprox. 1 minuto, el dispositivo volverá a estar listo para el servicio.
- Funcionamiento defectuoso de los contactos: En contactos soldados por sobrecalentamiento no es posible reactivar el dispositivo después de abrirse el circuito de entrada.
- No está encendido el LED “Power”: Cortocircuito o falta la tensión de alimentación.

Errori - guasti

- Cortocircuito nel circuito d’ingresso: Un fusibile elettronico interrompe l’alimentazione ed i contatti di sicurezza si aprono. Una volta rimosso la causa del gausto e interrotto la tensione di alimentazione, il dispositivo sarà pronto al funzionamento dopo circa un minuto.
- Malfunzionamenti dei contatti: In caso di contatti saldati tra loro, non è possibile la riattivazione dopo l’apertura del circuito di ingresso.
- Il LED «Power» non si accende: cortocircuito o mancanza della tensione di alimentazione.

Fouten - Storingen

- Kortsluiting in het ingangscircuit: De voedingsspanning valt uit en de veiligheidscontacten worden via een elektronische zekering geopend. Na het wegvallen van de storingsoorzaak en het uitschakelen van de bedrijfsspanning voor ca. 1 minuut is het apparaat weer bedrijfsklaar.
- Contactfout: bij verkleefde contacten is na openen van het ingangscircuit geen nieuwe activering mogelijk.
- LED „Power“ licht niet op: kortsluiting of voedingsspanning ontbreekt.

Son válidas las versiones actuales de las normas 11/03.

Per le norme citate, sono applicate le versioi in vigore a 11/03.

Van toepassing zijn de in 11/03 actuele versies van de normen.

Corriente máxima permanente en carga simultanea de varios contactos/Corrente permanente max. con carico simultaneo di più contatti/Max. duurstroom bij gelijktijdige belasting van meerdere contacten (AC1, DC1)

Número de contactos/Numero dei contatti/Aantal contacten	3	2	1
Imax (A) por contacto en tensión de alimentación AC/ per contatto con corrente AC/per contact bij een AC voedingsspanning	6,0	7,0	8,0
Imax (A) por contacto en tensión de alimentación DC/ per contatto con corrente DC/per contact bij een DC voedingsspanning	6,0	7,0	8,0

Para evitar una falla de los dispositivos, se debe procurar una suficiente extinción de chispas en todos los contactos de salida. En cargas capacitivas se deben tener en cuenta los picos de corriente. Con contactores de DC, utilizar diodos de marcha libre para la extinción de chispas, para aumentar la vida útil de los contactores.

Per impedire l'avaria dei dispositivi, assicu-rare su tutti i contatti di uscita un sufficiente spegnimento della scintilla. Per i carichi ca-pacitivi, rispettare gli eventuali picchi di cor-rente. Per i relè DC, utilizzare diodi auto-scillanti per lo spegnimento della scintilla per aumentare la durata dei relè stessi.

Om een falen van de relais te verhinderen, moet aan alle uitgangscontacten voor een adequate vonkblussing gezorgd worden. Bij capacitieve belasting dienen eventueel op-tredende stroompieken vermeden te wor-den. Bij DC-magneetschakelaars vrijloopdioden voor vonkblussing gebruiken om de levensduur van de magneetschakelaars te verlengen.

Vida útil de los relés de salida/Durata dei relè di uscita/Levensduur van de uitgangsrelais

WARNING

HEALTH AND SAFETY WARNING

The following precautions must be taken before disconnecting and removing a chain from a system prior to replacement.

1. **Always isolate the power source from the drive or equipment.**
2. **Always wear safety glasses.**
3. **Always wear appropriate protective clothing, hats, gloves and safety shoes as warranted by the circumstances.**
4. **Always ensure tools are in good working condition and used in the proper manner.**
5. **Always loosen tensioning devices.**
6. **Always support the chain to avoid sudden unexpected movement of chain or components.**
7. **Never attempt to disconnect or reconnect a chain unless the chain construction is fully understood.**
8. **Always ensure that directions for the correct use of any tools are followed.**
9. **Never reuse individual components.**
10. **Never reuse a damaged chain or chain part.**

N.B. Breach of these practices could result in serious injury or death.

Chain Installation and Maintenance

Introduction

Renold Chain has over 100 years' experience in the operation and maintenance of transmission chain. Involvement with designers, manufacturers and users of all types of equipment has enabled Renold to develop this definitive guide, designed to pass on the preferred methods of correct handling, adjustment, installation and maintenance of transmission chain drives resulting in maximum chain life.

Should you require any further information, please contact our technical sales staff.

Equipment Needed

The breaking of chain can be achieved by using a Renold Chain Extractor, these being:-

- 311015 for light industrial chains up to 0.5" pitch.
- 10101 for chains from 0.375" to 0.625" pitch
- 10102 for chains from 0.75" to 1.25" pitch

For joining any chain up to 2.5" pitch, a drift punch will be required.

Erection of medium or heavy chain drives requires millwrighting equipment such as lifting tackle, slings, wedges, packing, etc.

OTHER USEFUL EQUIPMENT
Quantity of inner and outer links.
Straight edges and/or strong, fine line.
Spirit level.
Plumb line.
Selection of hammers, files, key blanks, etc.

Preparation

Check equipment to ensure that general transmission requirements are correct (e.g. flexible couplings, flywheel, means of drive adjustment).

Check condition and rigidity of the shafts and bearings, particularly if there has been considerable previous service with an alternative method of transmission. Replace or rectify if necessary.

Driver and driven shafts should be checked to ensure they are level and parallel to each other. This applies equally to the jockey shaft if present.

Use a spirit level and adjustable comparator bar or micrometer between shafts at extreme points on each side of the drive. Rectify any parallelism error present and mark a permanent datum line for the adjustable shaft.

Place sprockets or respective shafts in approximate alignment and fit the keys in accordance with correct engineering practice. Do not finally secure keys at this stage.

Care must be taken with sprockets of split design to ensure perfect abutting of the faces of each half. Proceed with the key fitting after the halves are finally bolted together, otherwise the key can prevent correct assembly and subsequently result in malgearing.

It should be verified that key heads will not project beyond the width of any chaincases.

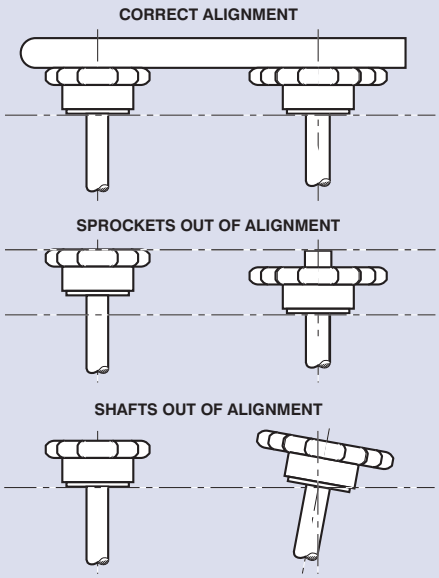
Checking Sprocket Alignment

Accurate alignment of shafts and sprocket tooth faces provides a uniform distribution of load across the entire chain width and contributes substantially to maximum drive life.

Use a straight edge across the machined faces of the sprockets in several different positions, if possible, as a check against wobble. A nylon or similar line is a good substitute for a straight edge particularly on longer centre distances.

Should endwise "float" of shafts be present, make due allowance so that sprocket alignment is correct at the mid position of "float".

When alignment is correct within closest practical limits, drive the keys home and take a final check on sprocket alignment.



IMPORTANT NOTE

Sprockets should always be designed to be as close to the supporting bearings as possible.

Installation of Chain

Renold Chain should not be assembled on the sprockets until attention has been paid to:

1. Cleanliness of the sprocket teeth, particularly if debris of an abrasive nature (cement dust, weld spatter, etc.), has been prevalent whilst work was in progress.

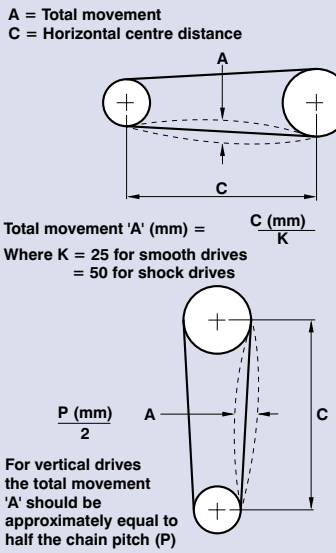
2. Temporary positioning of the lower section of a chaincase if present. In restricted spaces, manoeuvering of large sections is often simplified by using the spaces between shafts which will later be occupied by the chain.

Ensure the chain is clean and free from debris and place around the sprockets, observing instructions where matched strands are involved. In chain of two or more strands, joining is most easily accomplished at the mid span of the drive, drawing the chain ends together with a chain clamp or rope tackle block. Ensure that the strength of the drawing tackle is sufficient to hold the chain. Chain weights are shown in the Renold catalogue. When inserting the joining link of multiplex chain, ensure the intermediate plates are assembled. Do not detach the drawing tackle until the link is completely assembled. When only partially inserted through inner links, the weight of the chain on release can “splay” unsupported bearing pins.

Adjust the chain using the datum mark mentioned in the preparation section to retain shaft parallelism.

For a chain of average centre distance (30-50 x chain pitch) correct adjustment is when the mid point of the longest span can be fully moved by hand in accordance with dimension ‘A’ shown in diagram one.

Diagram one



Over-tensioning should be avoided in all cases.

CHAINCASES

- Position the chaincase bottom sections with the shafts concentric in their cavities.
- Manufacture suitable mountings and brackets to ensure rigidity.
- Assemble the oil supply and return pipe system and the drive to the oil pump.
- Assemble top section(s) of chaincase.
- Fill the oil sump and check delivery to the chain.

Chain Adjustment

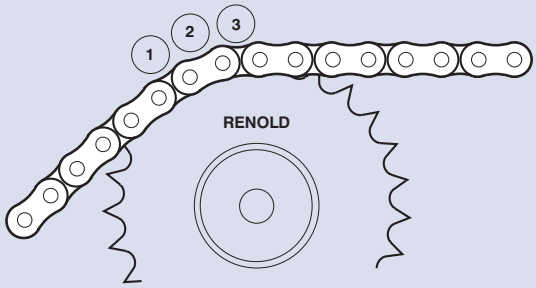
To maximise chain life, some form of chain length adjustment must be provided, preferably by moving one of the shafts. See diagram three. If shaft movement is not possible, an adjustable jockey sprocket engaging with the unloaded strand of the chain is recommended. Generally, the jockey should have the same number of teeth as the driver sprocket and care should be taken to ensure speed does not exceed the maximum ratings shown.

The chain should be adjusted regularly so that with one strand tight the slack strand can be moved a distance of 'A' at the mid point. See diagram one, on this page.

To cater for any eccentricities of mounting, the adjustment of the chain should be tried through a complete revolution of the large sprocket.

Adjustment, as shown in these diagrams, is achieved either by the movement of one of the shafts or by use of the jockey sprocket. The amount of the adjustment provided by either method should be sufficient to take up chain wear amounting to two pitches or two percent elongation above nominal chain length, whichever is the smaller.

Diagram two



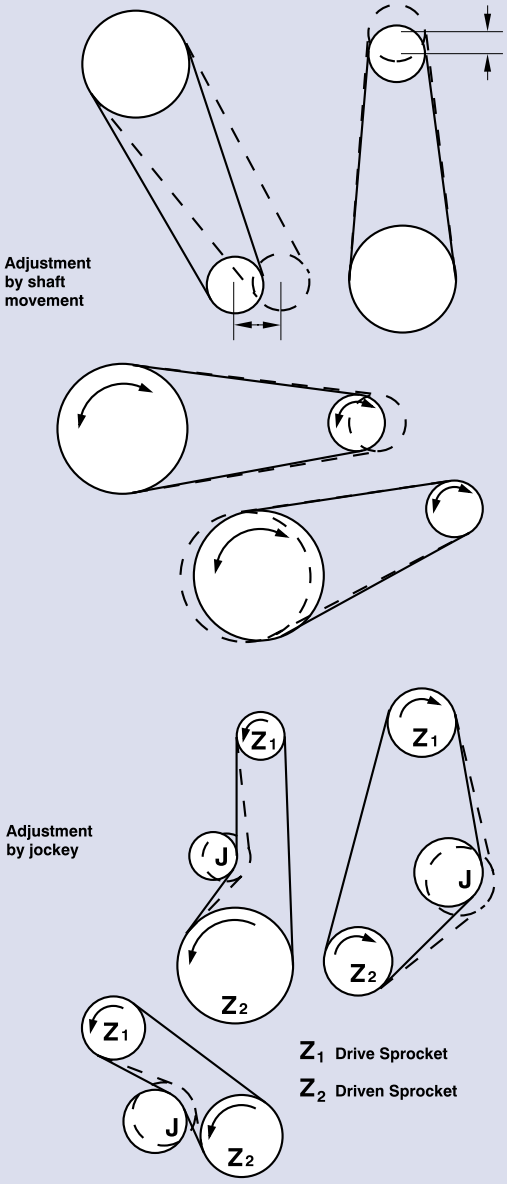
When used for adjustment, a jockey should be positioned on the unloaded side of the chain, preferably nearer to the driven sprocket and gearing with the outside of the chain; it should have an initial chain lap of at least three teeth and a free length of chain not less than four pitches between it and the nearest sprocket. See diagram two above.

Generally, the number of teeth in any jockey should not be less than the smallest sprocket and care should be taken to ensure that the speed does not exceed the maximum recommended. Where necessary, several sprockets can be used on a single drive, thereby meeting all possible needs for adjustment.

Chain Installation and Maintenance

All mountings for jockeys should be rigid and when manual adjustment is provided, the moving member must be securely locked in position after adjustments have been made.

Diagram three



AUTOMATIC ADJUSTMENT

Automatic adjustment can also be provided, but this adjustment generally demands a special study of the conditions to enable a suitable design to be provided.

Test Run

It is advisable to give the drive a short test run for the following reasons:

1. To regulate oil delivery to the chain.
2. To eliminate any oil weeps from the chain case and pipework.
3. To check for any unusual noise or vibration.

Maintenance Schedule

Regular chain maintenance is important if maximum life is to be achieved. In a correctly sized and installed drive the chain can be expected to last for approximately 15,000 hours.

The following maintenance schedule is suggested.

AFTER 3 MONTHS

- Check chain adjustment and rectify if necessary.
- Change oil, oil filter and clear the sump.

ANNUALLY

- Carry out the above checks.
- Check for wear on side plates.
- Check for chain elongation.
- Check cleanliness of components.
  - Remove any accumulation of dirt or foreign materials.
- Check for shaft and sprocket alignment.
- Check for wear on sprockets.
- Check the condition of the lubricant.
- Check the lubrication system.
  - Feed pipes are not clogged.
  - Lubrication schedule is being followed (manual lubrication).
  - Drip rate is sufficient (drip system).
  - Oil level is correct (drip, bath and disc systems).
  - Pump is working (stream system).

Chain Protection

A new Renold chain should always be stored in its box and/or bag until installation. Renold chain is lubricated at the factory, but this lubrication will not stand up to outdoor conditions, particularly where there is a salt water atmosphere.

Unprotected, lubricated chains will become contaminated with grit and other materials which will harm the chain and tend to clog strainers, filters and oil lines. A roller chain is a precision made series of bearings that will perform best if handled and stored in correct conditions.

Lubrication

Renold Chain drives should be protected against dirt and moisture and be lubricated with good quality, non-detergent petroleum based oil. A periodic change of oil is desirable as already outlined. Heavy oils and greases are generally too stiff to enter the chain working surfaces and should not be used.

Care must be taken to ensure that the lubricant reaches the bearing area of the chain. This can be done by directing the oil into the clearances between the inner and outer link plates, preferably at the point where the chain enters the sprocket on the bottom strand.

The table below indicates the correct lubricant viscosity for various ambient temperatures.

Ambient Temperature Celsius	Lubricant SAE	Rating BS4231
-5 to +5	20	46 to 68
5 to 40	30	100
40 to 50	40	150 to 220
50 to 60	50	320

For the majority of applications in the above temperature range, a multigrade SAE 20/50 oil would be suitable.

USE OF GREASE

As mentioned above, the use of grease is not recommended. However, if grease lubrication is essential the following points should be noted:

- Limit chain speed to 4 metre/sec.
- Applying normal greases to the outside surfaces of a chain only seals the bearing surfaces and will not work into them. This causes premature failure. Grease has to be heated until fluid and the chain are immersed and allowed to soak until all air bubbles cease to rise. If this system is used the chains need regular cleaning and regreasing at intervals, depending on the drives, power and speed.

ABNORMAL AMBIENT TEMPERATURES

For elevated temperatures up to 250°C, dry lubricants such as colloidal graphite or MoS_2 in white spirit or poly-alkaline glycol carriers are most suitable.

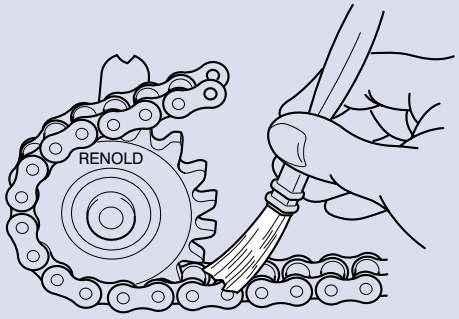
Conversely, at low temperatures between -5° and -40°C, special low temperature initial greases and subsequent oil lubricants are necessary. Lubricant suppliers will give recommendations.

LUBRICATING METHODS

There are four basic methods for lubricating chain drives. The recommended methods are shown in the rating charts which are determined by the chain speed and power transmitted.

TYPE 1, Manual Lubrication

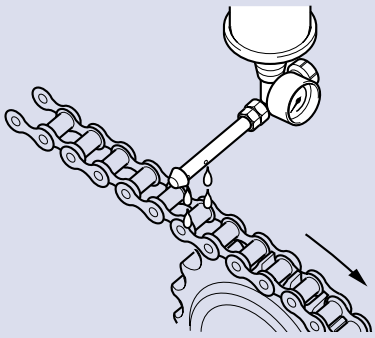
Oil is applied periodically with a brush or oil can, preferably once every 8 hours of operation. Volume and frequency should be sufficient to just keep the chain wet with oil and allow penetration of clean lubricant into the chain joints.



Applying lubricant by aerosol can be satisfactory under some conditions, but it is important that the aerosol lubricant is of an approved type for the application, such as that supplied by Renold. This type of lubricant penetrates into the pin/bush/roller clearances, resisting both the tendency to drip or drain when the chain is stationary and centrifugal "flinging" when the chain is moving.

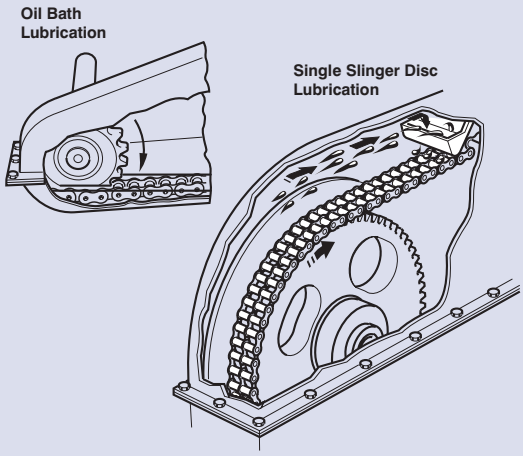
TYPE 2, Drip Lubrication

Oil drips are directed between the link plate edges from a drip lubricator. Volume and frequency should be sufficient to allow penetration of lubricant into the chain joints.



TYPE 3, Bath or Disc Lubrication

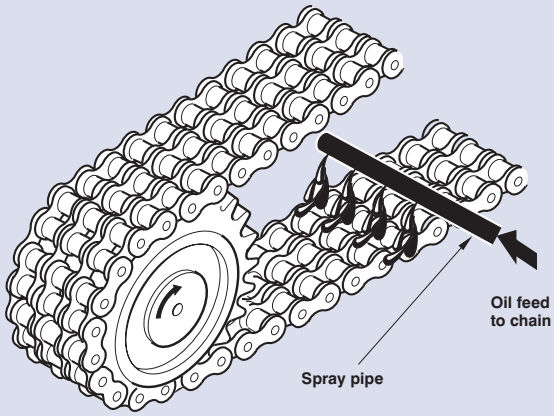
With oil bath lubrication, the lower strand of chain runs through a sump of oil in the drive housing. The oil level should cover the chain at its lowest point during operation.



Chain Installation and Maintenance

With slinger disc lubrication, an oil bath is used but the chain operates above the oil level. A disc picks up oil from the sump and deposits it on the chain by means of deflection plates. When such discs are employed they should be designed to have peripheral speeds between 180 to 2240 metre/min.

TYPE 4, Stream Lubrication
A continuous supply of oil from a circulating pump or central lubricating system is directed onto the chain. It is important to ensure that the spray holes from which the oil emerges are in line with the chain edges. The spray pipe should be positioned so that the oil is delivered onto the chain just before it engages with the driver sprocket.



This ensures that the lubricant is centrifuged through the chain and assists in cushioning roller impact on the sprocket teeth. Stream lubrication also provides effective cooling and impact damping at high speeds. It is, therefore, important that the method of lubrication specified is closely followed.

EFFECT OF TEMPERATURE

During operation an important factor to control in a drive system is the chain and chaincase temperature. Depending on the severity of the drive service, continuity of use, etc., special attention to the lubrication method may be required.

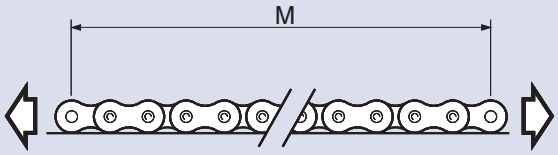
Chain temperatures above 100°C should be avoided if possible due to lubricant limitations, although chain can generally give acceptable performance up to around 250°C in some circumstances. A way of improving the effectiveness of the lubrication and its cooling effect is to increase the oil volume (up to 4.5 litres per minute per chain strand) and incorporate a method of external cooling for the oil.

To Measure Chain Wear

A direct measure of chain wear is the extension in excess of the nominal length of the chain and the chain wear can, therefore, be ascertained by length measurement in line with the instructions given below.

- Lay the chain, which should terminate at both ends with an inner link (part No. 4), on a flat surface and, after anchoring it at one end, attach to the other end a turnbuckle and a spring balance suitably anchored.
- Apply a tension load by means of the turnbuckle amounting to:

For simple chain: P^2 x 0,77 Newtons
For duplex chain: P^2 x 1,56 Newtons
For triplex chain: P^2 x 2,33 Newtons
Where P is the pitch in mm.



In the case of extended pitch chains (e.g. chains having the same breaking load and twice the pitch) apply a measuring load as for the equivalent short pitch chains.
As an alternative to the use of a turnbuckle and spring balance, the chain may be hung vertically and the equivalent weight attached to the lower end.

- Measure length 'M' (see diagram) in millimetres from which the percentage extension can be obtained from the following formula:

$$\text{Percentage extension} = \frac{M - (X \times P)}{X \times P} \times 100$$

Where X = number of pitches measured
P = pitch in mm

- As a general rule, the useful life of the chain is terminated and the chain should be replaced when the percentage extension reaches 2 per cent (1 per cent in the case of extended pitch chains). For drives with no provision for adjustment, the rejection limit is lower, dependent upon the speed and layout. A usual figure is between 0.7 and 1.0 per cent extension.

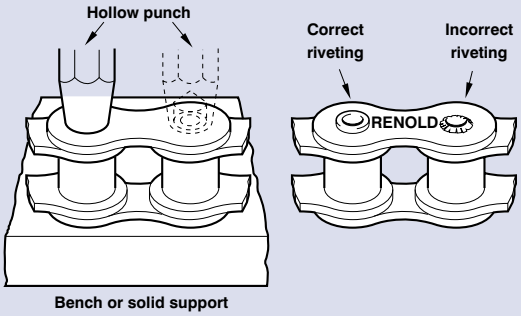
RENOLD CHAIN WEAR GUIDE

A simple to use chain wear guide is available from Renold Chain for most popular sizes of chain pitch. Please contact your sales office for details.

Riveting Chain Endless

TRANSMISSION CHAINS UP TO 63.5mm (2.5") PITCH

- Insert the bearing pins of the outer link (No. 107) through the inner links of the chain to be joined. If multiplex chain, assemble intermediate plates at the same time.
- Provide support for the outer link (No. 107) while assembling the separate outer plate. This has a force fit and is driven onto the bearing pins using a hollow punch alternatively on each pin. Drive up to the shoulder on the shouldered bearing pins. Where there is no shoulder the plate is driven to the point of similar clearance between outer and inner links as with the adjacent chain.



- Still supporting the outer link (No. 107), rivet the bearing pin ends, taking care to finish with a neat uniform spread having a similar appearance to the machine riveted pins in the adjacent chain. The force required to spread the pin end will vary with the pitch of the chain; excessive riveting force should always be avoided. Except where final chain joining in-situ is necessary, the work should be carried out on a bench.
- Check that the newly fitted link articulates freely in the adjacent inner links.

Chain Length Alterations

All drives should be designed wherever possible, with sufficient overall adjustment to ensure the use of an even number of pitches throughout the useful life of the chain. Cranked links should never be used on implusive, highly loaded or high speed chain drives.

In less arduous conditions where there is no other solution and the use of a cranked link is unavoidable, the diagrams show how length alteration can be accomplished.

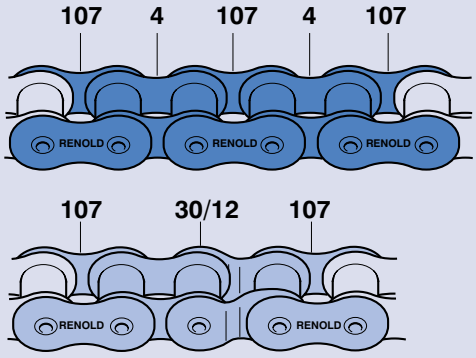
A chain having an even number of links requires the incorporation of a cranked link to effect an alteration of one pitch.

Chain having an odd number of links incorporates a cranked link which must be removed to effect an alteration of one pitch.

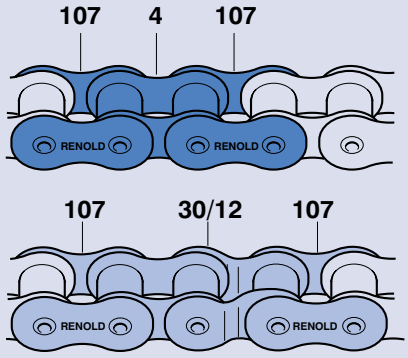
By removing the parts shown in dark shading and substituting those in light shading a chain can be shortened or lengthened by one pitch.

No joint which relies on a press fit for assembly should be reused after removal. A new joint should always be employed.

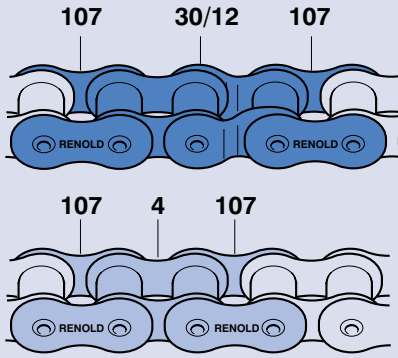
Using Cranked Link Double No. 30 (or No. 12 where 30's are not available).



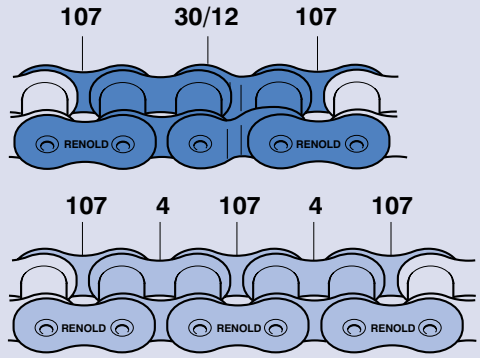
To shorten an even link chain by one pitch



To lengthen an even link chain by one pitch



To shorten an odd link chain by one pitch



To lengthen an odd link chain by one pitch

Pairing and Matching Chains

Any application in which two or more strands of transmission chain are required to operate side by side in a common drive or conveying arrangement, may involve the need for either pairing or matching, and such applications generally fall into one of the following categories:

Length Matching for Conveying and Similar Applications

Wherever length matching of transmission chain is necessary it is dealt with as follows:

- The chains are accurately measured in handling lengths between 3m to 8m as appropriate and then selected to provide a two (or more) strand drive having overall length uniformity within close limits. However, such length uniformity will not necessarily apply to any intermediate sections along the chains, but the actual length of all intermediate sections, both along and across the drive, will not vary more than our normal manufacturing limits. However, adapted transmission chains are usually manufactured to specific orders which are generally completed in one production run so that it is reasonable to assume that length differences of intermediate sections will be small.

- Chains are supplied in sets which are uniform in overall length within reasonably fine limits and will be within our normal manufacturing limits. It should be noted that chain sets supplied against different orders at different times may not have exactly the same lengths to those supplied originally, but will vary by no more than our normal tolerance of 0.0%, +0.15%.

Pitch Matching Transmission Drive Chains

Pitch matched chains are built up from shorter subsections (usually 300 to 600mm lengths) which are first measured and then graded for length. All subsections in each grade are of closely similar length and those forming any one group across the set of chains are selected from the same length grade.

The requisite number of groups are then connected to form a pitch matched set of chains, or alternatively, if this is too long for convenient handling, a set of handling sections for customer to assemble as a final set of pitch matched chain. Suitable tags are fixed to the chains to ensure they are connected together in the correct sequence.

Identification of Handling Lengths

	Handling Length 1	Handling Length 2	Handling Length 3
A Strand	A-A1	A1-A2	A2-A3
B Strand	B-B1	B1-B2	B2-B3
C Strand	C-C1	C1-C2	C2-C3

Long chains are made up in sections, each section being numbered on end links. Sections should be so joined up that end links with similar numbers are connected. Where chains are to run in sets of two or more strands, each strand is stamped on end links of each section with a letter, in addition to being numbered. Correct consecutive sections for each strand must be identified from the end links and joined up as indicated.

By these means, the actual length of any intermediate portion of one strand (as measured from any one pitch point to any other) will correspond closely with that of the transversely equivalent portion on the other strands, generally within 0.05mm, depending on the chain pitch size.

Pitch Matching Adapted Transmission Chains
(when attachments are fitted to chains)

With the sole exception of extended bearing pins, it is not possible to match the pitch of holes in attachments themselves to within very fine limits, due to the additional tolerances to be contended with (bending, holing, etc.).

Colour Coding

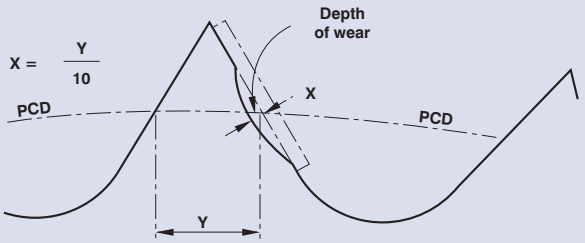
For customers who wish to match their chains, perhaps in order to fit special attachments in situ, Renold colour code short lengths of chain within specified tolerance bands. These will normally be RED, YELLOW or GREEN paint marks to indicate lower, mid and upper thirds of the tolerance band. For even finer tolerance bands additional colours can be used, but normally a maximum of five colours will be more than adequate.

COLOUR	RED	0.05%
	YELLOW	0.10%
	GREEN	0.15%
	BLUE	For Finer
	WHITE	Tolerances

Repair and Replacement

SPROCKETS
Examination of the tooth faces will give an indication of the amount of wear which has occurred. Under normal circumstances this will be evident as a polished worn strip about the pitch circle diameter on each of the sprocket teeth as shown below.

If the depth of this wear 'X' has reached an amount equal to 10% of the 'Y' dimension, then steps should be taken to replace the sprocket. Running new chain on sprockets having this amount of tooth wear will cause rapid chain wear.



It should be noted that in normal operating conditions, with correct lubrication the amount of wear 'X' will not occur until several chains have been used.

CHAIN
Chain repair should not as a rule be necessary. A correctly selected and maintained chain should gradually wear out over a period of time, approximately 15000 hours, but it should not fail. A length extension check as detailed on page 82 will give an indication of the service life remaining.

If a transmission chain sustains damage due to an overload, jam-up, or by riding over the sprocket teeth, it should be carefully removed from the drive and given a thorough visual examination. Remove the lubricating grease and oil to make the job easier.

Depending on the damage, it may be practicable to effect temporary repairs using replacement links (shown on page 5). It is not, however, a guarantee that the chain has not been overstressed and so made vulnerable to a future failure. The best policy therefore is to remove the source of trouble and fit a new chain.

If a chain has failed two or more times, it is certain the chain will fail again in time. If no replacement is immediately available repair the chain, but replace it at the nearest opportunity.

The entire chain should be replaced because of the following reasons:

- The cost of down time to the system or machine can often outweigh the cost of replacing the chain.
- A new or even used portion of chain or joints assembled into the failed chain will cause whipping and load pulsation. This can and probably will produce rapid failure of the chain and will accelerate wear in both the chain and its sprockets.

Assembling Connecting Links

When assembling a connecting link with a slip fit outer plate, it is necessary that this plate is pushed down on the pins to permit insertion of the fastener. Always ensure the No. 27 spring clip (as is illustrated on the No. 26 joint on page 5), has the closed end in the direction of rotation.

On a press fit connecting link it is necessary to drive the outer plate down far enough on the pins to allow insertion of the two split pins, but not so far as to create a tight joint.

By doing the above, three important things are accomplished.

- The desired clearances between the link plates across the chain width are maintained. Any outer link plate driven too far down the pins 'squeezes' the joint, so that no lubrication can get to the bearing surfaces. Such 'squeezing' of a joint prevents a chain articulating freely around the sprockets.
- Correct assembly of a connecting link into a chain will ensure a smooth gearing action with a minimum of whipping.
- With the split pins or spring clip snugly positioned against the side plate and the closed end of a spring clip fitted in the right direction, there will be less of a tendency for them to work loose and fall off.

Safety Warnings

CONNECTING LINKS
No. 11 or No. 26 joints (slip fit) should not be used where high speed or arduous conditions are encountered. In these or equivalent circumstances where safety is essential, a riveting link No. 107 (interference fit) must be used.

GOOD DESIGN PRACTICES
For high speed drives or drives operating in arduous conditions, a properly riveted outer link (No. 107) should always be used for optimum security, in preference to any other form of chain joint.

The use of other connectors and cranked links (No. 12 and No. 30) should always be restricted to light duty, non-critical applications, in drives where an odd number of pitches is absolutely unavoidable.

Wherever possible, drives should have sufficient overall adjustment to ensure the use of an even number of pitches throughout the useful life of the chain. A cranked link joint should only be used as a last resort.

Health and Safety Warning

The following precautions must be taken before disconnecting and removing a chain from a drive prior to replacement, repair or length alteration.

1. Always isolate the power source from the drive or equipment.
2. Always wear safety glasses.
3. Always wear appropriate protective clothing, hats, gloves and safety shoes as warranted by the circumstances.
4. Always ensure tools are in good working condition and used in the proper manner.
5. Always loosen tensioning devices.
6. Always support the chain to avoid sudden unexpected movement of chain or components.
7. Never attempt to disconnect or reconnect a chain unless the chain construction is fully understood.
8. Always ensure that directions for the correct use of any tools are followed.
9. Never reuse individual components.
10. Never reuse a damaged chain or chain part.
11. On light duty drives where a spring clip (No. 27) is used, always ensure that the clip is fitted correctly with the closed end pointing in the direction of travel.

Chain Installation and Maintenance

Troubleshooting

PROBLEM	PROBABLE CAUSE	SOLUTION
CHAIN CLIMBING OR JUMPING OFF THE SPROCKET TEETH	■ CHAIN OR SPROCKETS WORN	■ REPLACE THE CHAIN AND SPROCKETS IF NECESSARY
	■ CHAIN EXCESSIVELY SLACK	■ ADJUST THE CENTRE DISTANCE OR INTRODUCE A JOCKEY SPROCKET TO TAKE UP THE SLACK. IF ALLOWABLE, SHORTEN THE CHAIN
	■ INSUFFICIENT CHAIN WRAP	■ FOR LARGE RATIO DRIVES, THE DRIVER SPROCKET MAY NOT HAVE ENOUGH TEETH TO ABSORB THE WORKING TENSION. IF THE DRIVE CANNOT BE ALTERED, INTRODUCE A JOCKEY SPROCKET TO INCREASE THE CHAIN WRAP
	■ FOREIGN MATERIAL BUILD UP IN THE SPROCKET TOOTH GAPS	■ CLEAN THE SPROCKET TEETH OF ALL MATERIAL SO THAT THE CHAIN ENGAGES CORRECTLY
CHAIN DRIVE RUNNING HOT	■ LUBRICATION METHOD OR TYPE OF LUBRICATION IS UNSUITABLE FOR THE OPERATING SPEED AND POWER BEING TRANSMITTED	■ CHECK THE CATALOGUE SELECTION TABLES FOR THE CORRECT LUBRICATION METHOD
	■ INSUFFICIENT LUBRICATION	■ INCREASE THE FREQUENCY OF LUBRICATION IN LINE WITH GOOD MAINTENANCE PRACTICE
	■ CHAIN CONTINUALLY HITTING AN OBSTRUCTION	■ REMOVE THE OBSTRUCTION
	■ INCORRECT CHAIN SIZE SELECTED FOR THE SPEED AND TRANSMITTED POWER	■ CHECK THE CHAIN SELECTION AS A SMALLER PITCH OR MULTISTRAND CHAIN OF EQUIVALENT CAPACITY MAY BE REQUIRED
CHAIN ELONGATION (A GRADUAL INCREASE OVER ITS LIFE IS NORMAL)	■ LUBRICATION FAILURE	■ REPLACE CHAIN AND SPROCKETS
	■ AN OVERLOAD	■ CHECK LUBRICATION, DRIVE CONFIGURATION AND LOADINGS
	■ DISPLACEMENT OF THE BEARINGS	■ MONITOR DRIVE ELONGATION OVER A PERIOD OF 2-3 MONTHS BY CHECKING THE DEGREE OF SAG
	■ FAILURE OF THE TENSIONING DEVICE	■ CONTACT OUR TECHNICAL STAFF FOR ADVICE IF PROBLEM PERSISTS
CHAIN STIFFENS, STARTS TO WHIP	■ WORN CHAIN OR SPROCKETS	■ REPLACE CHAIN AND SPROCKETS
	■ EXCESSIVELY SLACK CHAIN	■ ADJUST CENTRES IF POSSIBLE OR INTRODUCE A TAKE-UP SYSTEM SUCH AS A JOCKEY SPROCKET. IT IS ALSO POSSIBLE TO SHORTEN THE CHAIN BY ONE OR MORE PITCHES
	■ HEAVY & IMPULSIVE LOAD	■ REDUCE THE LOADING
	■ CENTRE DISTANCE TOO LONG	■ ADD A JOCKEY SPROCKET ON LONG CENTRE DISTANCES
	■ ONE OR MORE STIFF JOINTS	■ REMOVE OR REPAIR STIFF JOINTS

Troubleshooting

PROBLEM	PROBABLE CAUSE	SOLUTION
EXCESSIVE NOISE	■ MISALIGNMENT OF SPROCKETS	■ MISALIGNMENT INTRODUCES ABNORMAL LOADING AND WEAR. RECHECK ALIGNMENT TO MAINTAIN NORMAL DRIVE CONDITIONS
	■ INADEQUATE LUBRICATION	■ IMPROVE THE LUBRICATION METHOD TO ENSURE THE PROPER AMOUNT OF LUBRICATION IS AVAILABLE IN THE BEARING AREAS
	■ WORN OR INCORRECTLY FITTED BEARINGS	■ REPLACE OR CORRECT THE BEARINGS AS THESE WILL MALIGN THE ENTIRE DRIVE
	■ CHAIN EXCESSIVELY SLACK OR TIGHT	■ ADJUST THE CENTRE DISTANCE IF POSSIBLE OR INTRODUCE A JOCKEY SPROCKET
	■ WORN CHAIN OR SPROCKETS	■ REPLACE THE CHAIN AND WHERE NECESSARY THE SPROCKETS. CONSIDER HARDENED TEETH
	■ TIGHT JOINTS	■ REPLACE OR REPAIR JOINTS
	■ HEAVY IMPULSIVE LOADS	■ REDUCE THE LOAD OR INTRODUCE A JOCKEY SPROCKET
	■ CHAIN PITCH SIZE TOO LARGE	■ CHECK THE CHAIN SELECTION OR CONTACT OUR TECHNICAL STAFF
	■ OBSTRUCTION IN THE CHAINS PATH	■ REMOVE THE OBSTRUCTION
HEAVY WEAR ON SPROCKET TEETH WORKING FACES. (A BRIGHT POLISHED APPEARANCE IS NORMAL)	■ POOR LUBRICATION	■ IMPROVE THE METHOD OF LUBRICATION, (SEE LUBRICATION SECTION)
	■ PRESENCE OF ABRASIVE	■ CHECK FOR PRESENCE OF FOREIGN MATERIALS AND ELIMINATE THE SOURCE. REPLACE SPROCKETS AND CHAIN IF NECESSARY
PIN FAILS	■ SYSTEM LOADING IS GREATER THAN THE CAPACITY OF THE CHAIN	■ CHECK THE KILOWATT RATING TABLE TO DETERMINE IF THE CHAIN CAPACITY HAS BEEN EXCEEDED. LARGER PITCH CHAIN OR A MULTISTRAND CHAIN MAY BE REQUIRED IF THE LOAD CONDITIONS CANNOT BE CORRECTED
ROLLER OR BUSH FAILS	■ CHAIN CAPACITY HAS BEEN EXCEEDED AT HIGH SPEED CAUSING IMPACT ON THE SPROCKET TEETH	■ CHECK THE DRIVE SELECTION. A SMALLER PITCH CHAIN, A MULTISTRAND CHAIN OR SPROCKETS WITH MORE TEETH MAY BE REQUIRED
	■ TOOTH MARKS ON THE OUTSIDE OF THE ROLLER DIAMETER CAN INITIATE FAILURE	■ IF THE ROLLERS ARE MARKED BY THE SPROCKET TEETH, ADJUST THE CENTRE DISTANCE

Chain Installation and Maintenance

Troubleshooting

PROBLEM	PROBABLE CAUSE	SOLUTION
RUST PRESENT ON CHAIN	■ INADEQUATE LUBRICATION. THIS WILL ALSO AFFECT THE JOINTS WHICH WILL BE DISCOLOURED, (LIGHT TO DARK BROWN) AND COULD BE ROUGH, GROOVED OR GALLED	■ REMOVE SEVERAL JOINTS AND CHECK THAT THE COMPONENTS ARE NOT SEVERELY DAMAGED. REPLACE CHAIN AND SPROCKETS AS NECESSARY. IMPROVE LUBRICATION METHOD.
SIDE PLATE FAILS	■ FATIGUE FAILURE IS CAUSED BY REPETITIVELY LOADING THE CHAIN ABOVE ITS LIMIT	■ CHECK THE DRIVE SELECTION, A LARGER PITCH CHAIN OR A MULTISTRAND CHAIN MAY BE REQUIRED
	■ IMPULSIVE DRIVE CONDITIONS CAN ALSO CAUSE FATIGUE FAILURE	■ IF NOT THE ABOVE, CHECK FOR EXCESSIVE SLACK. THIS MAY INDICATE WORN CHAIN AND SPROCKETS. REPLACE WHERE REQUIRED
SIDE PLATES ARE WORN	■ WEAR ON THE INSIDE OF THE PLATE IS CAUSED BY SPROCKET MISALIGNMENT	■ CHECK AND ADJUST SPROCKET AND SHAFT ALIGNMENT
	■ WEAR ON THE TOP OF THE SIDE PLATE IS CAUSED BY THE CHAIN RUBBING AGAINST THE CHAINCASE OR SOME OBSTRUCTION	■ REMOVE SOURCE OF RUBBING BY REMOVING THE OBSTRUCTION OR ADDING A JOCKEY SPROCKET TO CONTROL THE SLACK IN THE CHAIN
WEAR ON THE SIDES OF THE SPROCKET TEETH	■ DRIVE MISALIGNMENT	■ CHECK AND CORRECT SPROCKET AND SHAFT ALIGNMENT

SAFETY MESSAGES

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that potentially raises safety issues is indicated by a warning symbol (⚠). Please refer to the following safety messages before performing an operation preceded by this symbol.

Warnings

⚠WARNING

Failure to follow these installation guidelines could result in death or serious injury.

- Make sure only qualified personnel perform the installation.

Explosions could result in death or serious injury.

- Do not remove the connection head cover in explosive atmospheres when the circuit is live.
- Before connecting HART or FOUNDATION fieldbus in an explosive atmosphere, make sure the instruments in the loop are installed in accordance with intrinsically safe or non-intrinsic field wiring practices.
- Verify that the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.
- All connection head covers must be fully engaged to meet explosion-proof requirements.

Process leaks could result in death or serious injury.

- Do not remove the thermowell while in operation.
- Install and tighten thermowells and sensors before applying pressure

Electrical shock could cause death or serious injury.

- Use extreme caution when making contact with the leads and terminals.

OVERVIEW

Manual

This manual is designed to assist in the installation, operation, and maintenance of Rosemount 644 head mount and 644 rail mount.

Section 1: Introduction

- Transmitter and Manual Overview
- Considerations
- Return of Material

Section 2: Installation

- Mounting
- Installation
- Wiring
- Power Supply
- Commissioning

Section 3: HART Configuration

- Rosemount HART Communicator
- Configuration
- Multidrop Communication

Section 4: FOUNDATION Fieldbus Configuration

- Calibration
- Hardware Maintenance
- Diagnostic Messaging

Appendix A: Specifications and Reference Data

- Specifications
- Dimensional drawings
- Ordering Information
- Biotechnology, Pharmaceutical Industries, and Sanitary Applications

Appendix B: Approvals

- Product Certifications
- Installation Drawings

Appendix C: Foundation Fieldbus Block Information

- Information regarding the Function Blocks

Transmitter

Features of the Rosemount 644 include:

- Accepts inputs from a wide variety of sensors
- Configuration using HART protocol or FOUNDATION fieldbus
- Electronics that are completely encapsulated in epoxy and enclosed in a metal housing, making the transmitter extremely durable and ensuring long-term reliability
- A compact size and two housing options allowing mounting flexibility for the control room or the field

Refer to the following literature for a full range of compatible connection heads, sensors, and thermowells provided by Emerson Process Management.

- Temperature Sensors and Assemblies Product Data Sheet, Volume 1 (document number 00813-0100-2654)
- Temperature Sensors and Assemblies Product Data Sheet, Volume 2 (document number 00813-0200-2654)

CONSIDERATIONS

General

Electrical temperature sensors such as RTDs and thermocouples produce low-level signals proportional to their sensed temperature. The 644 converts the low-level sensor signal to a standard 4–20 mA dc, digital HART, or digital Foundation fieldbus signal that is relatively insensitive to lead length and electrical noise. This signal is then transmitted to the control room via two wires.

Commissioning

The transmitter can be commissioned before or after installation. It may be useful to commission it on the bench, before installation, to ensure proper operation and to become familiar with its functionality. Make sure the instruments in the loop are installed in accordance with intrinsically safe, FISCO, or non-incendive field wiring practices.

Mechanical

Location

When choosing an installation location and position, take into account the need for access to the transmitter.

Special Mounting

Special mounting hardware is available for mounting a 644 head mount transmitter to a DIN rail, or assembling a new 644 head mount to an existing threaded sensor connection head (former option code L1).

Electrical

Proper electrical installation is necessary to prevent errors due to sensor lead resistance and electrical noise. For best results, shielded cable should be used in electrically noisy environments.

Make wiring connections through the cable entry in the side of the connection head. Be sure to provide adequate clearance for cover removal.

Environmental

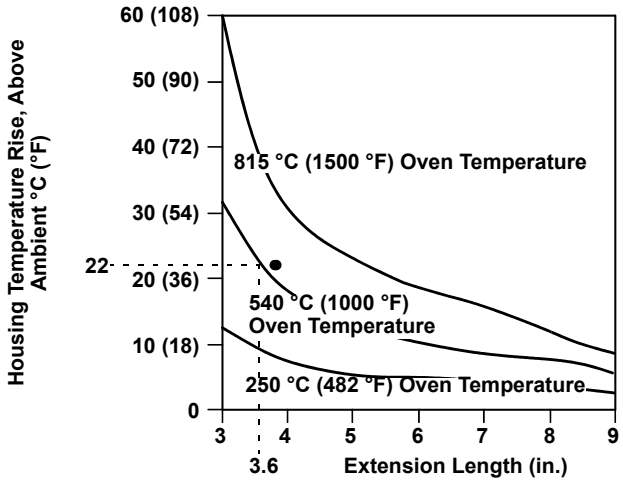
The transmitter electronics module is permanently sealed within the housing, resisting moisture and corrosive damage. Verify that the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.

Temperature Effects

The transmitter will operate within specifications for ambient temperatures between –40 and 185 °F (–40 and 85 °C). Heat from the process is transferred from the thermowell to the transmitter housing. If the expected process temperature is near or beyond specification limits, consider the use of additional thermowell lagging, and extension nipple, or a remote mounting configuration to isolate the transmitter from the process.

Figure 1-1 provides an example of the relationship between transmitter housing temperature rise and extension length.

Figure 1-1. 644 head mount Transmitter Connection Head Temperature Rise vs. Extension Length



Example

The transmitter specification limit is 85 °C. If the ambient temperature is 55 °C and the process temperature to be measured is 800 °C, the maximum permissible connection head temperature rise is the transmitter specification limit minus the ambient temperature (moves 85 to 55 °C), or 30 °C.

In this case, an extension of 100 mm meets this requirement, but 125 mm provides a margin of 8 °C, thereby reducing any temperature effects in the transmitter.

RETURN OF MATERIALS

To expedite the return process in North America, call the Emerson Process Management National Response Center toll-free at 800-654-7768. This center, available 24 hours a day, will assist you with any needed information or materials.

⚠ The center will ask for the following information:

- Product model
- Serial numbers
- The last process material to which the product was exposed

The center will provide

- A Return Material Authorization (RMA) number
- Instructions and procedures that are necessary to return goods that were exposed to hazardous substances

For other locations, please contact a Emerson Process Management sales representative.

NOTE
If a hazardous substance is identified, a Material Safety Data Sheet (MSDS), required by law to be available to people exposed to specific hazardous substances, must be included with the returned materials.

SAFETY MESSAGES

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that potentially raises safety issues is indicated by a warning symbol (⚠). Please refer to the following safety messages before performing an operation preceded by this symbol.

Warnings

⚠WARNING

Failure to follow these installation guidelines could result in death or serious injury.

- Make sure only qualified personnel perform the installation.

Explosions could result in death or serious injury.

- Do not remove the connection head cover in explosive atmospheres when the circuit is live.
- Before connecting a HART Communicator in an explosive atmosphere, make sure the instruments in the loop are installed in accordance with instrinsically safe or non-incendive field wiring practices.
- Verify that the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.
- All connection head covers must be fully engaged to meet explosion-proof requirements.

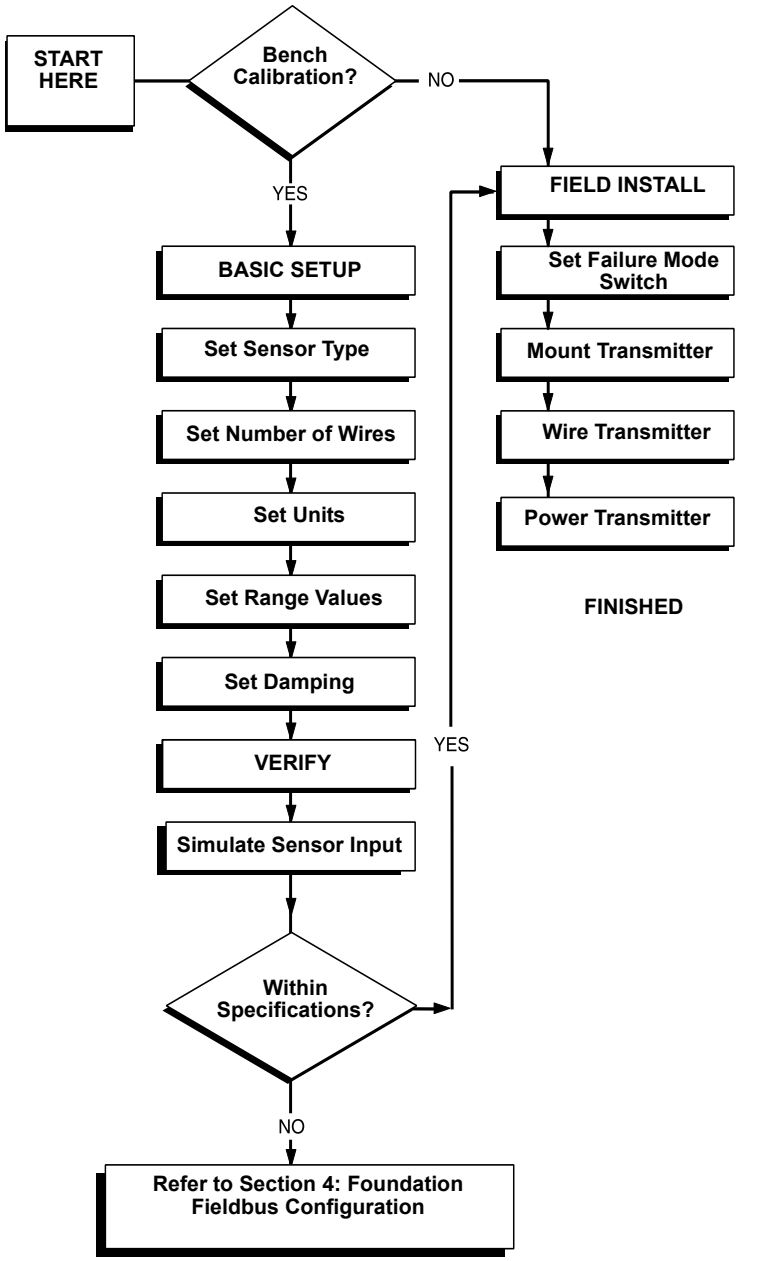
Process leaks could result in death or serious injury.

- Do not remove the thermowell while in operation.
- Install and tighten thermowells and sensors before applying pressure

Electrical shock could cause death or serious injury.

- Use extreme caution when making contact with the leads and terminals.

Figure 2-1. Installation Flowchart



MOUNTING

Mount the transmitter at a high point in the conduit run to prevent moisture from draining into the transmitter housing.

The 644 head mount installs

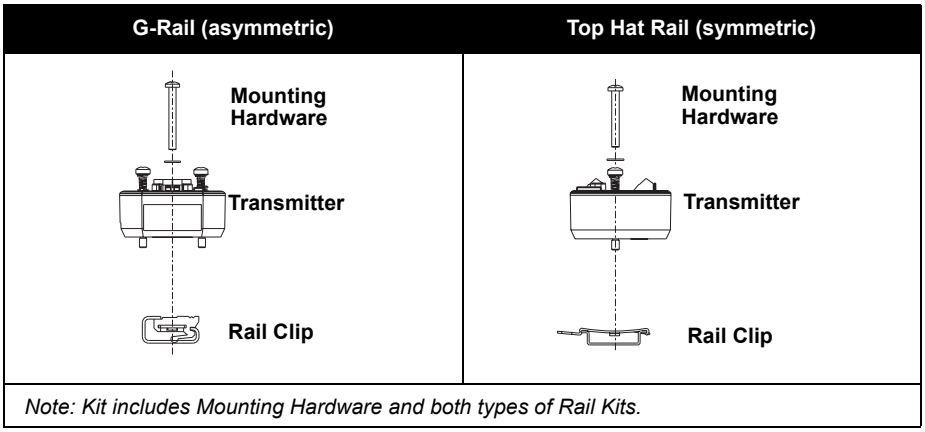
- In a connection head or universal head mounted directly on a sensor assembly
- Apart from a sensor assembly using a universal head
- To a DIN rail using an optional mounting clip.

The 644 rail mount attaches directly to a wall or to a DIN rail.

Mounting a 644H to a DIN Rail

To attach a head mount transmitter to a DIN rail, assemble the appropriate rail mounting kit (part number 00644-5301-0010) to the transmitter as shown in Figure 2-2. Follow the procedure under “Rail Mount Transmitter and Sensor (HART only)”.

Figure 2-2. Assembling Rail Clip Hardware to a 644H

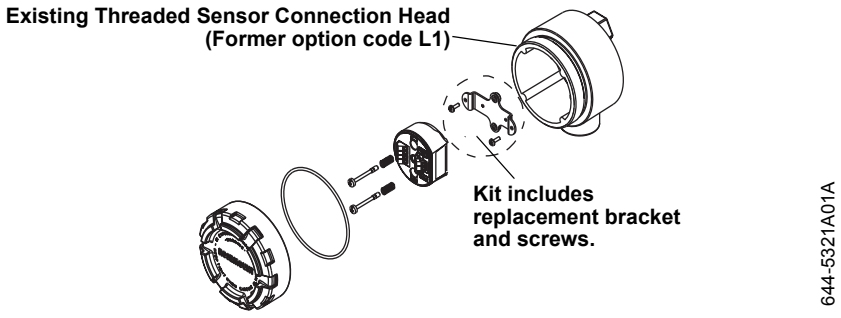


Note: Kit includes Mounting Hardware and both types of Rail Kits.

Retrofitting a 644H for Use in an Existing Threaded Sensor Connection Head

To mount a 644H in an existing threaded sensor connection head (former option code L1), order the 644H retrofit kit (part number 00644-5321-0010). The retrofit kit includes a new mounting bracket and all associated hardware necessary to facilitate the installation of the 644H in the existing head. See Figure 2-3.

Figure 2-3. Assembling 644H for Use in an Existing L1 Connection Head



INSTALLATION

Typical European Installation

Head Mount Transmitter with DIN Plate Style Sensor (HART and FOUNDATION fieldbus)

⚠ 1. Attach the thermowell to the pipe or process container wall. Install and tighten the thermowell before applying process pressure.

2. Verify the transmitter failure mode switch (HART only).

3. Assemble the transmitter to the sensor. Push the transmitter mounting screws through the sensor mounting plate and insert the snap rings (optional) into the transmitter mounting screw groove.

4. Wire the sensor to the transmitter (see Figure 2-9 on page 2-11).

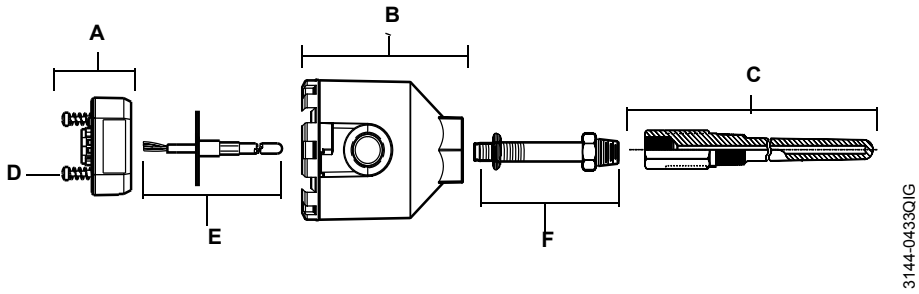
5. Insert the transmitter-sensor assembly into the connection head. Thread the transmitter mounting screw into the connection head mounting holes.Assemble the extension to the connection head. Insert the assembly into the thermowell.

6. Attach a cable gland into the shielded cable.

7. Insert the shielded cable leads into the connection head through the cable entry. Connect and tighten the cable gland.

⚠ 8. Connect the shielded power cable leads to the transmitter power terminals. Avoid contact with sensor leads and sensor connections.

⚠ 9. Install and tighten the connection head cover. Enclosure covers must be fully engaged to meet explosion-proof requirements.

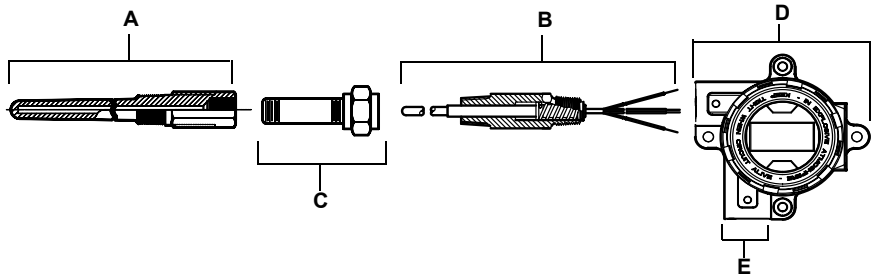


A = 644H Transmitter	D = Transmitter Mounting Screws
B = Connection Head	E = Integral Mount Sensor with Flying Leads
C = Thermowell	F = Extension

Typical North American Installation

Head Mount Transmitter with Threaded Sensor (HART and FOUNDATION fieldbus)

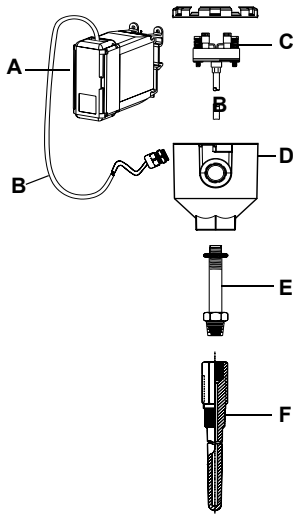
1. Attach the thermowell to the pipe or process container wall. Install and tighten thermowells before applying process pressure.
2. Attach necessary extension nipples and adapters to the thermowell. Seal the nipple and adapter threads with silicone tape.
3. Screw the sensor into the thermowell. Install drain seals if required for severe environments or to satisfy code requirements.
4. Verify the transmitter failure mode switch (HART only).
5. Pull the sensor wiring leads through the universal head and transmitter. Mount the transmitter in the universal head by threading the transmitter mounting screws into the universal head mounting holes.
6. Mount the transmitter-sensor assembly into the thermowell. Seal adapter threads with silicone tape.
7. Install conduit for field wiring to the conduit entry of the universal head. Seal conduit threads with silicone tape.
8. Pull the field wiring leads through the conduit into the universal head. Attach the sensor and power leads to the transmitter. Avoid contact with other terminals.
9. Install and tighten the universal head cover. Enclosure covers must be fully engaged to meet explosion-proof requirements.



A = Threaded Thermowell
B = Threaded Style Sensor
C = Standard Extension
D = Universal Head
E = Conduit Entry

Rail Mount Transmitter and Sensor (HART only)

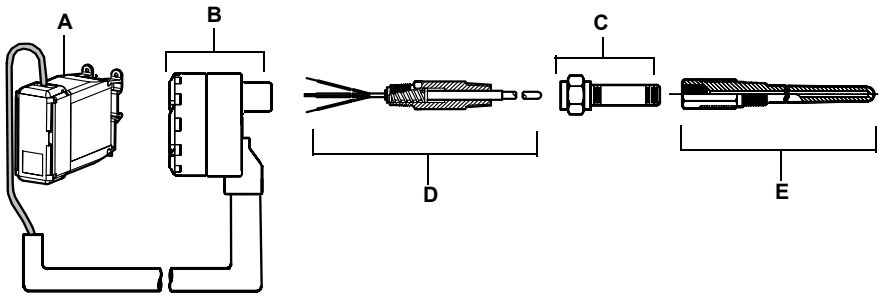
1. Attach the transmitter to a suitable rail or panel.
2. Attach the thermowell to the pipe or process container wall. Install and tighten the thermowell, according to plant standards, before applying pressure.
3. Attach the sensor to the connection head and mount the entire assembly to the thermowell.
4. Attach and connect sufficient lengths of sensor lead wire from the connection head to the sensor terminal block.
5. Tighten the connection head cover. Enclosure covers must be fully engaged to meet explosion-proof requirements.
6. Run sensor lead wires from the sensor assembly to the transmitter.
7. Verify the transmitter failure mode switch.
8. Attach the sensor wires to the transmitter (see Figure 2-9 on page 2-11).



A = Rail Mount Transmitter
B = Sensor Leads with Cable Glands
C = Integral Mount Sensor with Terminal Block
D = Connection Head
E = Standard Extension
F = Threaded Thermowell

Rail Mount Transmitter with Threaded Sensor (HART only)

1. Attach the transmitter to a suitable rail or panel.
2. Attach the thermowell to the pipe or process container wall. Install and tighten the thermowell before applying pressure.
3. Attach necessary extension nipples and adapters. Seal the nipple and adapter threads with silicone tape.
4. Screw the sensor into the thermowell. Install drain seals if required for severe environments or to satisfy code requirements.
5. Screw the connection head to the sensor.
6. Attach the sensor lead wires to the connection head terminals.
7. Attach additional sensor lead wires from the connection head to the transmitter.
8. Attach and tighten the connection head cover. Enclosure covers must be fully engaged to meet explosion-proof requirements.
9. Set the transmitter failure mode switch
10. Attach the sensor wires to the transmitter (see Figure 2-9 on page 2-11).



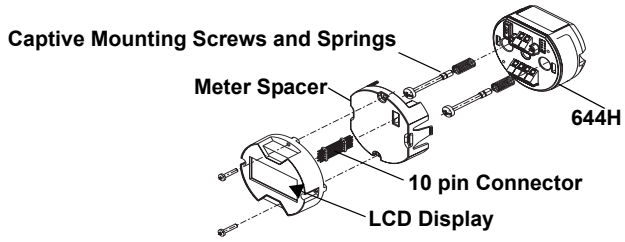
A = Rail Mount Transmitter
B = Threaded Sensor Connection Head
C = Standard Extension
D = Threaded Style Sensor
E = Threaded Thermowell

LCD Display Installation

The LCD display provides local indication of the transmitter output and abbreviated diagnostic messages governing transmitter operation. Transmitters ordered with the LCD display are shipped with the meter installed. After-market installation of the meter can be performed the transmitter has a meter connector (transmitter revision 5.5.2 or later). After-market installation requires the meter kit (part number 00644-4430-0001), which includes:

- LCD display assembly (includes LCD display, meter spacer, and 2 screws)
- Meter cover with O-ring in place

Figure 2-4. Installing the LCD Display



Use the following procedure to install the meter.

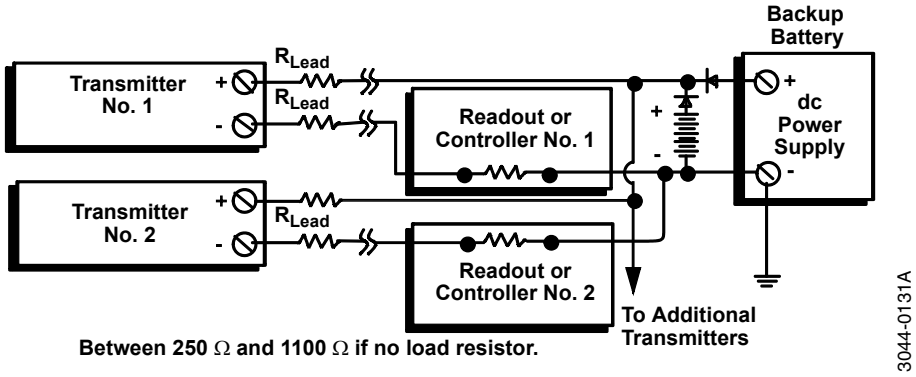
1. If the transmitter is installed in a loop, secure the loop and disconnect the power. If the transmitter is installed in an enclosure, remove the cover from the enclosure.
2. Decide meter orientation (the meter can be rotated in 90° increments). To change meter orientation, remove the screws located above and below the display screen. Lift the meter off the meter spacer. Remove the 8-pin plug and re-insert it in the location that will result in the desired viewing orientation.
3. Reattach the meter to the meter spacer using the screws. If the meter was rotated 90° from its original position it will be necessary to remove the screws from their original holes and re-insert them in the adjacent screws holes.
4. Line up the 10-pin connector with the 10-pin socket and push the meter into the transmitter until it snaps into place.
5. Attach the meter cover; tighten at least one-third turn after the O-ring contacts the transmitter housing. The cover must be fully engaged to meet explosion-proof requirements.
6. Use a HART Communicator, AMS software, or a FOUNDATION fieldbus Communication tool to configure the meter to the desired display. Refer to “LCD Meter Options (644H Only)” for information on configuring the LCD display.

NOTE
Observe the following LCD display temperature limits:
Operating: –4 to 185 °F (–20 to 85 °C)
Storage: –50 to 185 °F (–45 to 85 °C)

Multichannel Installations (HART)

In a HART installation, several transmitters can be connected to a single master power supply, as shown in Figure 2-5. In this case, the system may be grounded only at the negative power supply terminal. In multichannel installations where several transmitters depend on one power supply and the loss of all transmitters would cause operational problems, consider an uninterrupted power supply or a back-up battery. The diodes shown in Figure 2-5 prevent unwanted charging or discharging of the back-up battery.

Figure 2-5. Multichannel Installations



WIRING

⚠ All power to the transmitter is supplied over the signal wiring. Use ordinary copper wire of sufficient size to ensure that the voltage across the transmitter power terminals does not drop below 12.0 V dc for HART or 9 V dc for Foundation fieldbus.

⚠ If the sensor is installed in a high-voltage environment and a fault condition or installation error occurs, the sensor leads and transmitter terminals could carry lethal voltages. Use extreme caution when making contact with the leads and terminals.

NOTE
Do not apply high voltage (e.g., ac line voltage) to the transmitter terminals. Abnormally high voltage can damage the unit. (Sensor and transmitter power terminals are rated to 42.4 V dc. A constant 42.4 volts across the sensor terminals may damage the unit.)

For multichannel HART installations, see above. The transmitters will accept inputs from a variety of RTD and thermocouple types. Refer to Figure 2-6 on page 2-10 when making sensor connections. Refer to Figure 2-8 on page 2-10 for FOUNDATION fieldbus installations.

Use the following steps to wire the power and sensor to the transmitter:

1. Remove the terminal block cover (if applicable).
2. Connect the positive power lead to the "**+**" terminal. Connect the negative power lead to the "**–**" terminal (see Figure 2-7).
3. Tighten the terminal screws. When tightening the sensor and power wires, the max torque is 6-in.-lbs (0.7 N-m).
4. Reattach and tighten the cover (if applicable).
5. Apply power (see "Power Supply").

Figure 2-6. Transmitter Power, Communication, and Sensor Terminals

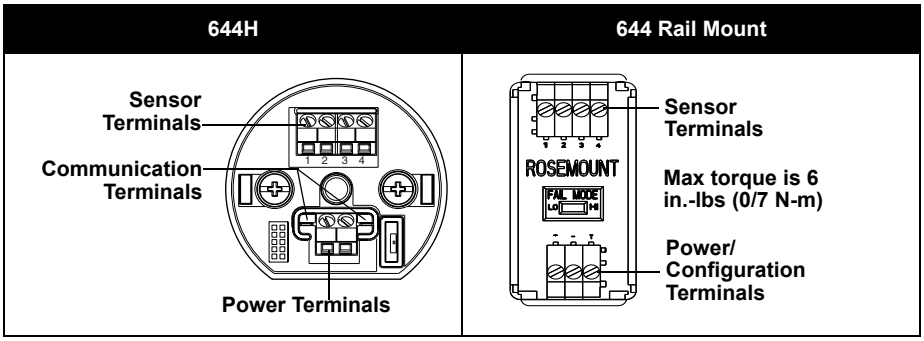


Figure 2-7. Connecting a HART Communication Tool to a Transmitter Loop

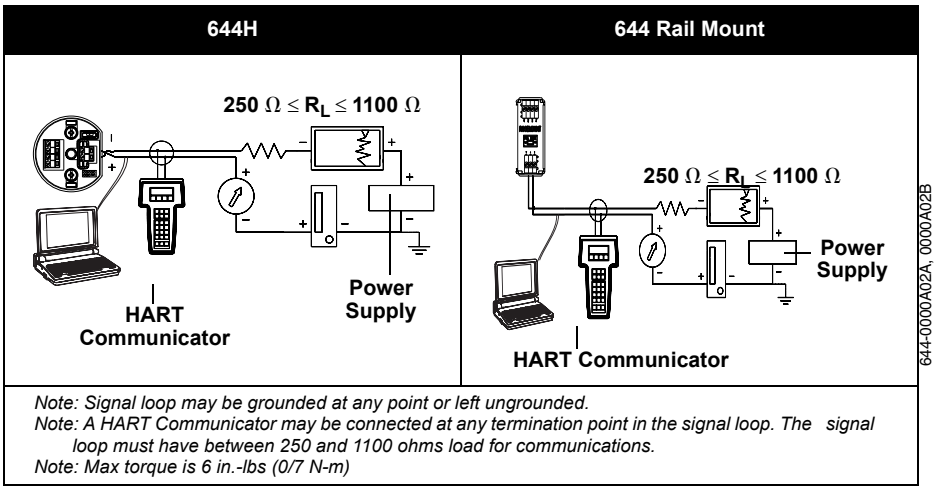
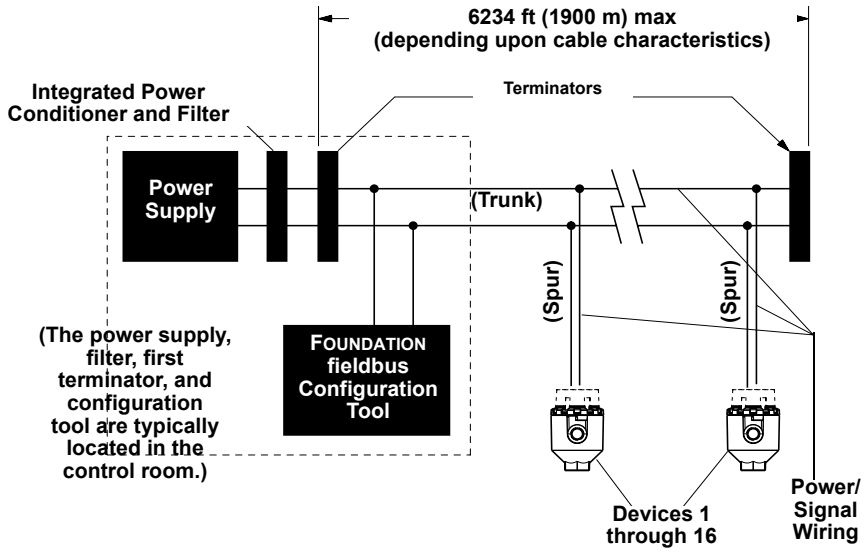


Note: Signal loop may be grounded at any point or left ungrounded.
Note: A HART Communicator may be connected at any termination point in the signal loop. The signal loop must have between 250 and 1100 ohms load for communications.
Note: Max torque is 6 in.-lbs (0/7 N-m)

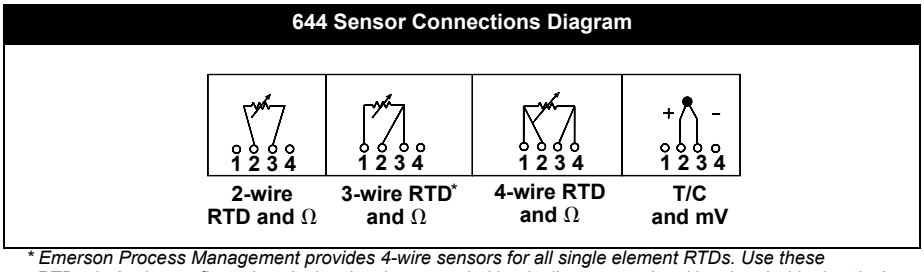
Figure 2-8. Connecting a FOUNDATION fieldbus Host System to a Transmitter Loop



Sensor Connections

⚠ The 644 is compatible with a number of RTD and thermocouple sensor types. Figure 2-9 shows the correct input connections to the sensor terminals on the transmitter. To ensure a proper sensor connection, anchor the sensor lead wires into the appropriate compression terminals and tighten the screws.

Figure 2-9. Sensor Wiring Diagrams



** Emerson Process Management provides 4-wire sensors for all single element RTDs. Use these RTDs in 3-wire configurations by leaving the unneeded leads disconnected and insulated with electrical tape.*

Thermocouple or Millivolt Inputs

The thermocouple can be connected directly to the transmitter. Use appropriate thermocouple extension wire if mounting the transmitter remotely from the sensor. Make millivolt inputs connections with copper wire. Use shielding for long runs of wire.

RTD or Ohm Inputs

The transmitters will accept a variety of RTD configurations, including 2-wire, 3-wire, 4-wire. If the transmitter is mounted remotely from a 3-wire or 4-wire RTD, it will operate within specifications, without recalibration, for lead wire resistances of up to 60 ohms per lead (equivalent to 6,000 feet of 20 AWG wire). In this case, the leads between the RTD and transmitter should be shielded. If using only two leads, both RTD leads are in series with the sensor element, so significant errors can occur if the lead lengths exceed three feet of 20 AWG wire (approximately 0.05 °C/ft). For longer runs, attach a third or fourth lead as described above.

Sensor Lead Wire Resistance Effect– RTD Input

When using a 4-wire RTD, the effect of lead resistance is eliminated and has no impact on accuracy. However, a 3-wire sensor will not fully cancel lead resistance error because it cannot compensate for imbalances in resistance between the lead wires. Using the same type of wire on all three lead wires will make a 3-wire RTD installation as accurate as possible. A 2-wire sensor will produce the largest error because it directly adds the lead wire resistance to the sensor resistance. For 2- and 3-wire RTDs, an additional lead wire resistance error is induced with ambient temperature variations. The table and the examples shown below help quantify these errors.

Table 2-1. Examples of Approximate Basic Error

Sensor Input	Approximate Basic Error
4-wire RTD	None (independent of lead wire resistance)
3-wire RTD	± 1.0 Ω in reading per ohm of unbalanced lead wire resistance (Unbalanced lead wire resistance = maximum imbalance between any two leads.)
2-wire RTD	1.0 Ω in reading per ohm of lead wire resistance

Examples of Approximate Lead Wire Resistance Effect Calculations

Given:

Total cable length:	150 m
Imbalance of the lead wires at 20 °C:	1.5 Ω
Resistance/length (18 AWG Cu):	0.025 Ω/m °C
Temperature coefficient of Cu (α_{Cu}):	0.039 Ω/Ω °C
Temperature coefficient of Pt(α_{Pt}):	0.00385 Ω/Ω °C
Change in Ambient Temperature (ΔT_{amb}):	25 °C
RTD Resistance at 0 °C (R_o):	100 Ω (for Pt 100 RTD)

- Pt100 4-wire RTD: No lead wire resistance effect.
- Pt100 3-wire RTD:

$$\text{Basic Error} = \frac{\text{Imbalance of Lead Wires}}{(\alpha_{Pt} \times R_o)}$$

$$\text{Error due to amb. temp. variation} = \frac{(\alpha_{Cu}) \times (\Delta T_{amb}) \times (\text{Imbalance of Lead Wires})}{(\alpha_{Pt}) \times (R_o)}$$

Lead wire imbalance seen by the transmitter = 0.5 Ω

$$\text{Basic error} = \frac{0.5\ \Omega}{(0.00385\ \Omega / \Omega\ °C) \times (100\ \Omega)} = 1.3\ °C$$

Error due to amb. temp. var. of ± 25 °C

$$= \frac{(0.0039\ \Omega / \Omega\ °C) \times (25\ °C) \times (0.5\ \Omega)}{(0.00385\ \Omega / \Omega\ °C) \times (100\Omega)} = \pm 13^{\cdot} °C$$

- Pt100 2-wire RTD:

$$\text{Basic Error} = \frac{\text{Lead Wire Resistance}}{(\alpha_{Pt} \times R_o)}$$

$$\text{Error due to amb. temp. variation} = \frac{(\alpha_{Cu}) \times (\Delta T_{amb}) \times (\text{Lead Wire Resistance})}{(\alpha_{Pt}) \times (R_o)}$$

Lead wire resistance seen by the transmitter = 150 m × 2 wires × 0.025 Ω/m = 7.5 Ω

$$\text{Basic error} = \frac{7.5\ \Omega}{(0.00385\ \Omega / \Omega\ °C) \times (100\ \Omega)} = 19.5\ °C$$

Error due to amb. temp. var. of ± 25 °C

$$= \frac{(0.0039\ \Omega / \Omega\ °C) \times (25\ °C) \times (7.5\ \Omega)}{(0.00385\ \Omega / \Omega\ °C) \times (100\Omega)} = \pm 1.9\ °C$$

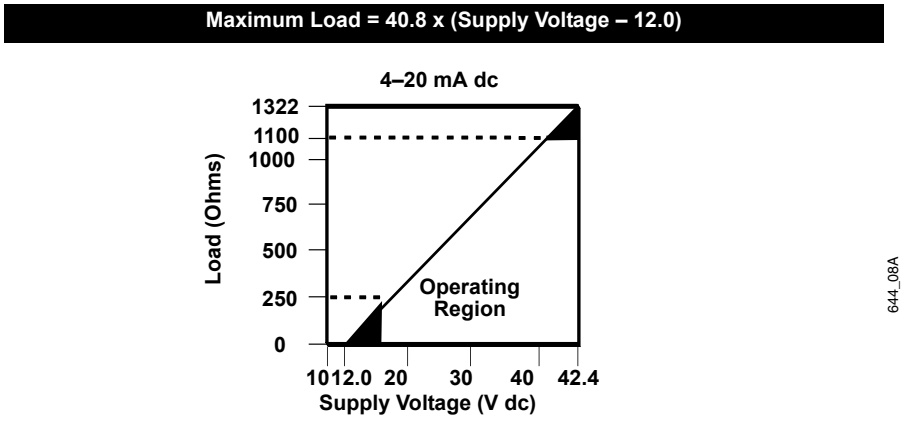
POWER SUPPLY

HART Installation

To communicate with a transmitter, a 18.1 V dc minimum power supply is required. The power supplied to the transmitter should not drop below the transmitter lift-off voltage (see Figure 2-10). If the power drops below the lift-off voltage while the transmitter is being configured, the transmitter may interpret the configuration information incorrectly.

The dc power supply should provide power with less than 2 percent ripple. The total resistance load is the sum of the resistance of the signal leads and the load resistance of any controller, indicator, or related pieces of equipment in the loop. Note that the resistance of intrinsic safety barriers, if used, must be included.

Figure 2-10. Load Limits



FOUNDATION fieldbus Installation

Powered over FOUNDATION fieldbus with standard fieldbus power supplies. The transmitter operates between 9.0 and 32.0 V dc, 11 mA maximum. Transmitter power terminals are rated to 42.4 VDC.

The power terminals on the 644 with FOUNDATION fieldbus are polarity insensitive.

Ground the Transmitter

The transmitter will operate with the current signal loop either floating or grounded. However, the extra noise in floating systems affects many types of readout devices. If the signal appears noisy or erratic, grounding the current signal loop at a single point may solve the problem. The best place to ground the loop is at the negative terminal of the power supply. Do not ground the current signal loop at more than one point.

The transmitter is electrically isolated to 500 V DC/AC rms (707 V dc), so the input circuit may also be grounded at any single point. When using a grounded thermocouple, the grounded junction serves as this point.

Neither side of the loop should be grounded on FOUNDATION fieldbus devices. Only the shield wire should be grounded.

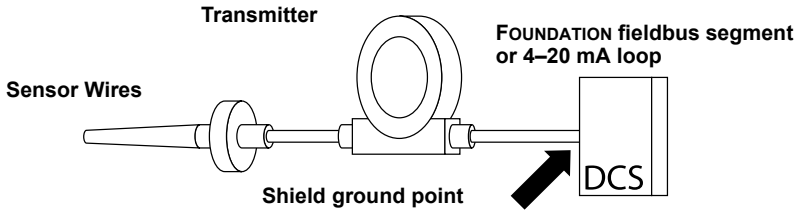
NOTE
Do not ground the signal wire at both ends.

Ungrounded Thermocouple, mV, and RTD/Ohm Inputs

Each process installation has different requirements for grounding. Use the grounding options recommended by the facility for the specific sensor type, or begin with grounding Option 1 (the most common).

Option 1:

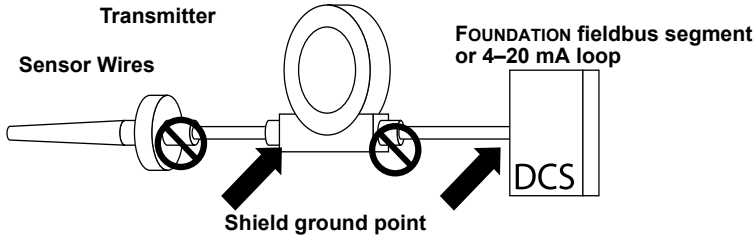
1. Connect signal wiring shield to the sensor wiring shield.
2. Ensure the two shields are tied together and electrically isolated from the transmitter housing.
3. Ground shield at the power supply end only.
4. Ensure that the sensor shield is electrically isolated from the surrounding grounded fixtures.



Connect shields together, electrically isolated from the transmitter

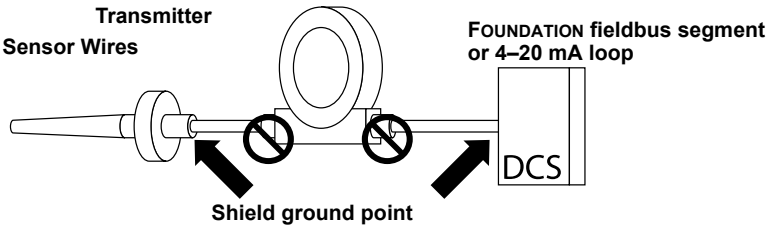
Option 2:

1. Connect sensor wiring shield to the transmitter housing (only if the housing is grounded).
2. Ensure the sensor shield is electrically isolated from surrounding fixtures that may be grounded.
3. Ground signal wiring shield at the power supply end.



Option 3:

1. Ground sensor wiring shield at the sensor, if possible.
2. Ensure that the sensor wiring and signal wiring shields are electrically isolated from the transmitter housing.
3. Do not connect the signal wiring shield to the sensor wiring shield.
4. Ground signal wiring shield at the power supply end.



Grounded Thermocouple Inputs

1. Ground sensor wiring shield at the sensor.
2. Ensure that the sensor wiring and signal wiring shields are electrically isolated from the transmitter housing.
3. Do not connect the signal wiring shield to the sensor wiring shield.
4. Ground signal wiring shield at the power supply end.

OVERVIEW

This section provides information on configuring, troubleshooting, operating, and maintaining the Rosemount 644 with HART protocol.

SAFETY MESSAGES

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that potentially raises safety issues is indicated by a warning symbol (⚠). Please refer to the following safety messages before performing an operation preceded by this symbol.

Warnings

⚠WARNING

Failure to follow these installation guidelines could result in death or serious injury.

- Make sure only qualified personnel perform the installation.

Explosions could result in death or serious injury.

- Do not remove the connection head cover in explosive atmospheres when the circuit is live.
- Before connecting a HART Communicator in an explosive atmosphere, make sure the instruments in the loop are installed in accordance with instrinsically safe or non-incendive field wiring practices.
- Verify that the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.
- All connection head covers must be fully engaged to meet explosion-proof requirements.

Process leaks could result in death or serious injury.

- Do not remove the thermowell while in operation.
- Install and tighten thermowells and sensors before applying pressure

Electrical shock could cause death or serious injury.

- Use extreme caution when making contact with the leads and terminals.

Surges/Transients

The transmitter will withstand electrical transients of the energy level encountered in static discharges or induced switching transients. However, high-energy transients, such as those induced in wiring from nearby lightning strikes, welding, heavy electrical equipment, or switching gears, can damage both the transmitter and the sensor. To protect against high-energy transients, install the transmitter into a suitable connection head with the Rosemount 470 Transient Protector. Refer to the 470 Transient Protector Product Data Sheet (document number 00813-0100-4191) for more information.

COMMISSIONING

The 644 must be configured for certain basic variables to operate. In many cases, all of these variables are pre-configured at the factory. Configuration may be required if the transmitter is not configured or if the configuration variables need revision.

Commissioning consists of testing the transmitter and verifying transmitter configuration data. Model 644 transmitters can be commissioned either before or after installation. Commissioning the transmitter on the bench before installation using a HART Communicator or AMS ensures that all transmitter components are in working order.

⚠ To commission on the bench, connect the transmitter and the HART Communicator or AMS as shown in Figure 2-7 on page 2-10. Make sure the instruments in the loop are installed according to intrinsically-safe or non-incendive field wiring practices before connecting a communication in an explosive atmosphere. Connect HART Communication leads at any termination point in the signal loop. For convenience, connect them to the terminals labeled “COMM” on the terminal block. Connecting across the “TEST” terminals will prevent successful communication. Avoid exposing the transmitter electronics to the plant environment after installation by setting all transmitter jumpers during the commissioning stage on the bench.

When using a HART Communicator, any configuration changes made must be sent to the transmitter by using the “Send” key (F2). AMS configuration changes are implemented when the “Apply” button is clicked.

For more information on using the HART Communicator with the 644 transmitter, see Section 3: HART Configuration.

Setting the Loop to Manual

When sending or requesting data that would disrupt the loop or change the output of the transmitter, set the process application loop to manual. The HART Communicator or AMS will prompt you to set the loop to manual when necessary. Acknowledging this prompt does not set the loop to manual. The prompt is only a reminder; set the loop to manual as a separate operation.

Failure Mode

As part of normal operation, each transmitter continuously monitors its own performance. This automatic diagnostics routine is a timed series of checks repeated continuously. If diagnostics detect an input sensor failure or a failure in the transmitter electronics, the transmitter drives its output to low or high depending on the position of the failure mode switch. Saturation levels are 3.90 mA for standard configuration (3.8 mA if configured for NAMUR-compliant operation) on the low end and 20.5 mA for standard or NAMUR-compliant configuration on the high end, if the sensor temperature is outside of range limits. These values are also custom configurable by the factory or using the HART Communicator.

The values to which the transmitter drives its output in failure mode depend on whether it is configured to standard, NAMUR-compliant, or custom operation. See “Hardware and Software Failure Mode” on page A-7 for standard and NAMUR-compliant operation parameters.

Changing Switch Positions

To change the failure mode on the 644 transmitter, follow the steps below.

⚠ 1. If applicable, remove the enclosure cover.

2. Locate the orange failure mode switch. On the 644H the switch is located near the power terminals and located in the center of the front panel on the 644 rail mount (see Figure 2-6).

3. Move the switch to the desired alarm setting. To set the failure mode to high alarm, position the switch toward the “HI” mark on the terminal block. To set the failure mode to low alarm, position the switch in the opposite direction.

⚠ 4. Replace the enclosure cover (if applicable). Enclosure covers must be fully engaged to meet explosion-proof requirements.

HART COMMUNICATOR

The HART Communicator exchanges information with the transmitter from the control room, the instrument site, or any wiring termination point in the loop. To facilitate communication, connect the HART Communicator in parallel with the transmitter (see Figure 2-11). Use the loop connection ports on the rear panel of the HART Communicator. The connections are non-polarized. Do not make connections to the serial port or the NiCad recharger jack in explosive atmospheres. Before connecting the HART communicator in an explosive atmosphere, make sure the instruments in the loop are installed in accordance with intrinsically safe or non-incendive field wiring practices.

For more information regarding the HART Communicator, please see the HART Communicator Reference Manual (document number 00809-0100-4275)

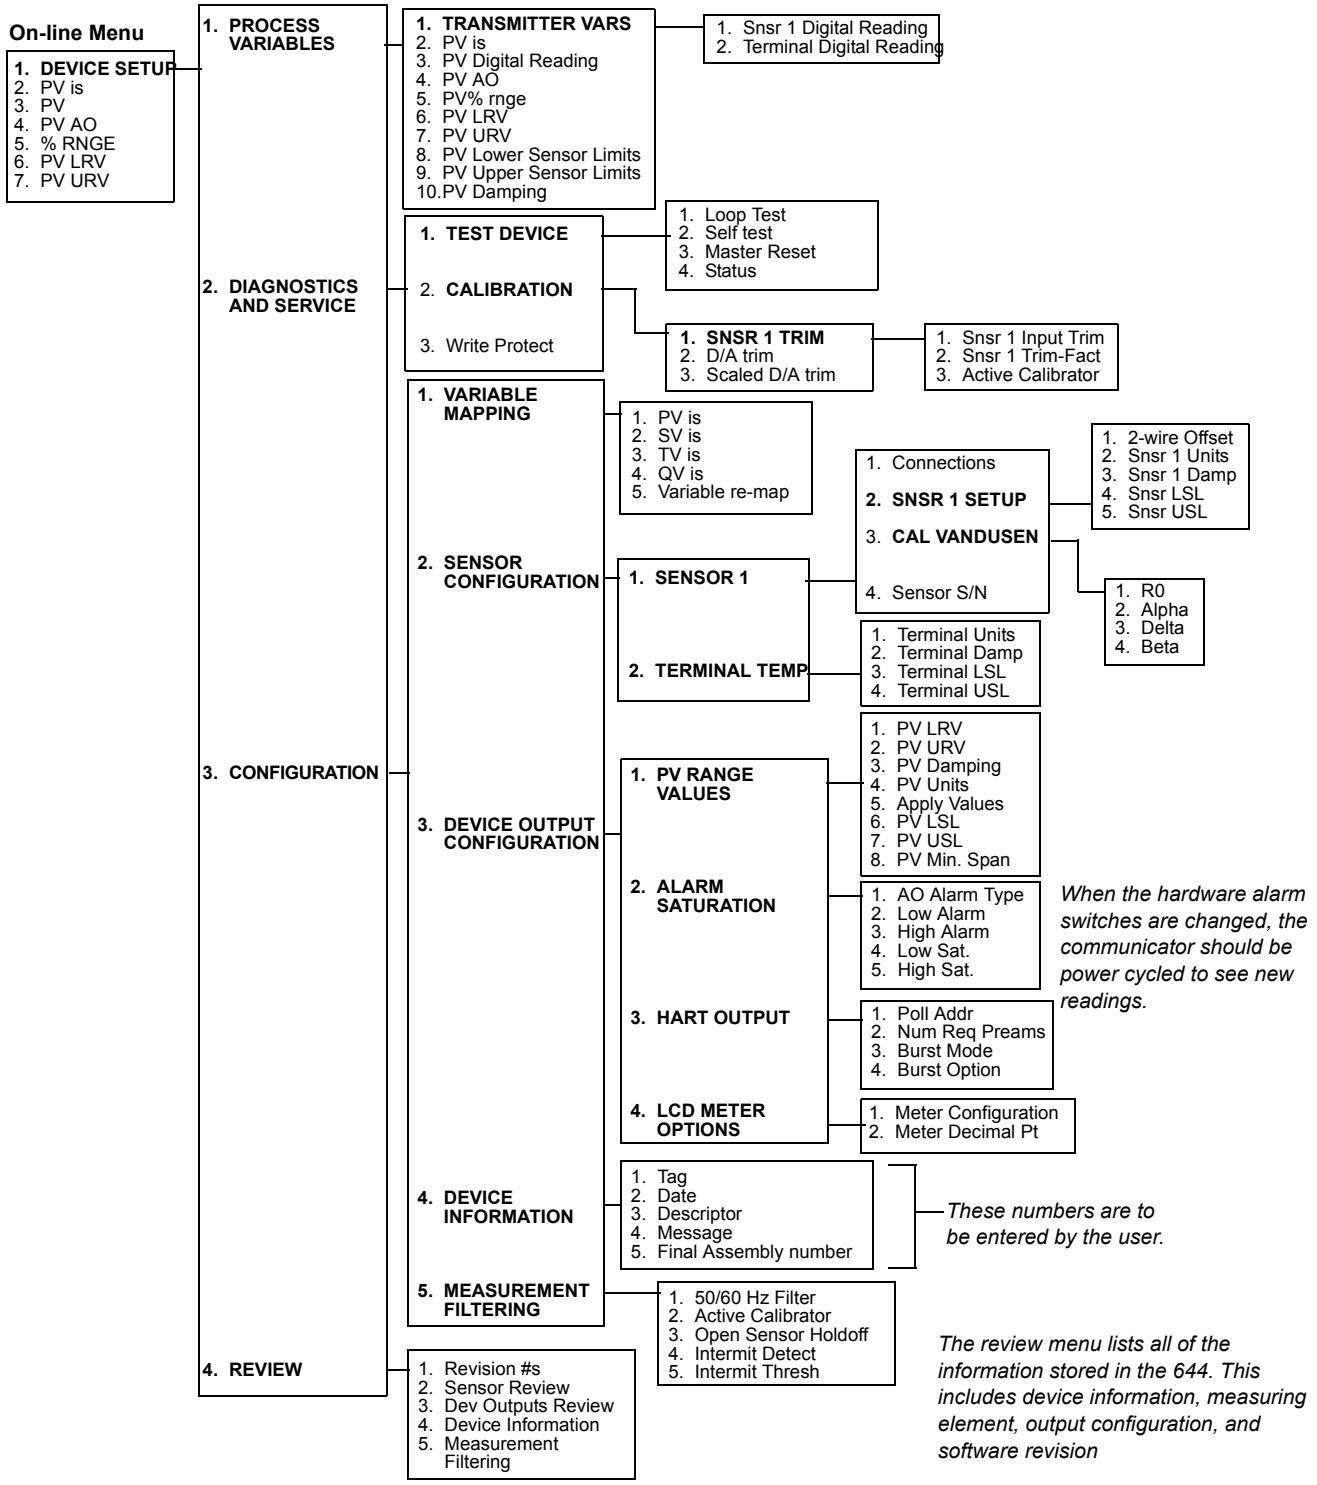
CONFIGURATION

The 644 transmitter can be configured either on-line or off-line using a HART Communicator or AMS. During on-line configuration, the transmitter is connected to a HART communicator. Data is entered in the working register of the communicator and sent directly to the transmitter. Off-line configuration consists of storing configuration data in a HART Communicator while it is not connected to a transmitter. Data is stored in nonvolatile memory and can be downloaded to the transmitter at a later time.

HART Menu Tree

Options listed in bold type indicate that a selection provides other options. For ease of operation, changing calibration and setup, such as sensor type, number of wires, and range values, can be completed in several locations.

Figure 3-1. HART Communicator Menu Tree



Fast Key Sequence

Table 3-1 lists the fast key sequences for common transmitter functions.

NOTE:
The fast key sequences assume that DD Dev v6, DD v1 is being used. Some features apply only to the 644H, as noted in the following pages. Table 3-1 provides alphabetical function lists for all HART Communicator tasks as well as their corresponding fast key sequences.

Table 3-1. 644 Fast Key Sequence

Function	Fast Keys
Active Calibrator	1, 2, 2, 1, 3
Alarm/Saturation	1, 3, 3, 2

AMS

One of the key benefits of intelligent devices is the ease of device configuration. When used with AMS, the 644 is easy to configure and provides instant and accurate alerts and alarms. The main configuration screen of the 644 is the “Configuration Properties” screen. From this screen, the transmitter set-up can easily be viewed and edited.

The screens use a color-coding to give visual indication of the transmitter health and to indicate any changes that may need to be made or written to the transmitter.

- Gray screens: indicates that all information has been written to the transmitter
- Yellow on screen: changes have been made in the software but not sent to the transmitter
- Green on screen: all current changes on screen have been written to the transmitter
- Red on screen: indicates an alarm or alert that requires immediate investigation

Apply AMS Changes

Changes made in the software must be *sent* to the transmitter in order for the changes to take effect in the process.

1. From the bottom of the “Configuration Properties” screen, click **Apply**.
2. An “Apply Parameter Modification” screen appears, enter desired information and click **OK**.
3. After carefully reading the warning provided, select **OK**.

Review Configuration Data

Before operating the 644 in an actual installation, review all of the factory-set configuration data to ensure that it reflects the current application.

Review

Fast Key Sequence	1, 4

When activating the *Review* function, scroll through the configuration data list to check each process variable. If changes to the transmitter configuration data are necessary, refer to “Configuration” below.

AMS
Right click on the device and select “Configuration Properties” from the menu. Select the tabs to review the transmitter configuration data.

Check Output

Before performing other transmitter on-line operations, review the 644 digital output parameters to ensure that the transmitter is operating properly.

Process Variables

Fast Key Sequence	1, 1

The *Process Variables* menu displays process variables, including sensor temperature, percent of range, analog output, and terminal temperature. These process variables are continuously updated. The primary variable is the 4 –20 mA analog signal. The secondary variable is the transmitter terminal temperature.

AMS
Right click on the device and select “Configuration Properties” from the menu. Select the Analog Output tab to review the transmitter Analog Output Range.

Configuration

The 644 must be configured for certain basic variables in order to be operational. In many cases, all of these variables are pre-configured at the factory. Configuration may be required if the transmitter is not configured or if the configuration variables need revision.

Variable Mapping

Fast Key Sequence	1, 3, 1

The *Variable Mapping* menu displays the sequence of the process variables. When using the 644H you can select *5 Variable Re-Map* to change this configuration. When the *Select PV* screen appears *Snsr 1* must be selected. Either *Sensor 1*, *Terminal Temperature*, or *not used* can be selected for the remaining variables. The primary variable is the 4–20 mA analog signal.

AMS
Right click on the device and select “Configuration Properties” from the menu. Select the Analog Output tab to review the Mapped Variable Output.

Apply changes made (see “Apply AMS Changes” on page 3-6).

Select Sensor Type

Fast Key Sequence	1, 3, 2, 1, 1

The *Connections* command allows selection of the sensor type and the number of sensor wires to be connected. Select from the following sensors:

- 2-, 3-, or 4-wire Pt 100, Pt 200, Pt 500, Pt 1000 RTDs: α = 0.00385 $\Omega/\Omega/°C$
- 2-, 3-, or 4-wire Pt 100: α = 0.003916 $\Omega/\Omega/°C$
- 2-, 3-, or 4-wire Ni 120 nickel RTDs
- 2-, 3-, or 4-wire Cu 10 RTDs
- IEC/NIST/DIN Type B, E, J, K, R, S, T thermocouples
- DIN type L, U thermocouples
- ASTM Type W5Re/W26Re thermocouple
- –10 to 100 millivolts
- 2-, 3-, or 4-wire 0 to 2000 ohms

Contact a Emerson Process Management representative for information on the temperature sensors, thermowells, and accessory mounting hardware that is available through Emerson Process Management.

AMS
Right click on the device and select “Sensor Connections,” then select “Sensor 1 Config.“Select “Sensor Connections.” The *wizard* will walk through the screens.

Sensor Serial Number

Fast Key Sequence	1, 3, 2, 1, 4

The *Sensor S/N* variable provides a location to list the serial number of the attached sensor. It is useful for identifying sensors and tracking sensor calibration information.

AMS
Right click on the device and select “Configuration Properties” from the menu. Select the Snsr 1 tab to configure the Snsr S/N.

Apply changes made (see “Apply AMS Changes” on page 3-6).

Set Output Units

Fast Key Sequence	1, 3, 2, 1, 2, 2

The *Set Output Unit* command sets the desired primary variable units. Set the transmitter output to one of the following engineering units:

- Degrees Celsius
- Degrees Fahrenheit
- Degrees Rankine
- Kelvin
- Ohms
- Millivolts

AMS
Right click on the device and select “Configuration Properties” from the menu. Select the Snsr 1 tab to configure the Sensor Output Units. Set the units to the desired output.

Apply changes made (see “Apply AMS Changes” on page 3-6).

50/60 Hz Filter

Fast Key Sequence	1, 3, 5, 1

The *50/60 Hz Filter* command sets the transmitter electronic filter to reject the frequency of the AC power supply in the plant.

AMS
Right click on the device and select “Configuration Properties” from the menu. Select the Electronics tab to configure the output frequency.

Apply changes made (see “Apply AMS Changes” on page 3-6).

Terminal Temperature

Fast Key Sequence	1, 3, 2, 2

The *Terminal Temp* command sets the terminal temperature units to indicate the temperature at the transmitter terminals.

AMS
Right click on the device and select “Configuration Properties” from the menu. Select the Electronics tab to configure the Terminal Temperature. In the Terminal Temperature box, set the Terminal Units to the desired output.

Apply changes made (see “Apply AMS Changes” on page 3-6).

LCD Meter Options (644H Only)

Fast Key Sequence	1, 3, 3, 4

The *LCD Meter Option* command sets the meter options, including engineering units and decimal point. Change the meter settings to reflect necessary configuration parameters when adding a meter or reconfiguring the transmitter.

To customize variables that the meter displays, follow the steps below:

1. From the home screen select *1 Device Setup*, *3 Configuration*, *3 Dev Output Config*, *4 LCD Meter Options*, and *1 Meter Config*.
2. Use the F2 key to turn each of the following options **OFF** or **ON**: Sensor 1, Terminal Temp, Percent Of Range, Analog Output. As many outputs as desired an be turned **ON** at once.
3. Press F4, **ENTER**, and then F2, **SEND**, to send the information to the transmitter. The LCD display will scroll through the outputs selected in step 2.

To change the decimal point configuration, perform the following steps:

1. From the home screen select *1 Device Setup*, *3 Configuration*, *3 Dev Output Config*, *4 LCD Meter Options*, and *1 Meter Decimal Pt*.
2. Choose from *Floating Precision* or *One-*, *Two-*, *Three-*, or *Four-Digit Precision* by pressing F4, **ENTER**. Press F2 to send the information to the transmitter.

AMS
Right click on the device and select “Configuration Properties” from the menu. Select the Device tab to configure the LCD. From the LCD Meter box, define the Meter Config, Meter Decimal Pt.

Apply changes made (see “Apply AMS Changes” on page 3-6).

Process Variable (PV) Damping

Fast Key Sequence	1, 3, 3, 1, 3

The *PV Damp* command changes the response time of the transmitter to smooth variations in output readings caused by rapid changes in input. Determine the appropriate damping setting based on the necessary response time, signal stability, and other requirements of the loop dynamics of the system. The default damping value is 5.0 seconds and can be reset to any value between 0 and 32 seconds.

The value chosen for damping affects the response time of the transmitter. When set to zero (or disabled), the damping function is off and the transmitter output reacts to changes in input as quickly as the intermittent sensor algorithm allows (refer to “Intermittent Threshold” on page 3-16 for a description of the intermittent sensor algorithm). Increasing the damping value increases the transmitter response time.

With damping enabled, if the temperature change is within 0.2% of the sensor limits, the transmitter measures the change in input every 500 milliseconds and outputs values according to the following relationship:

$$\text{Damped Value} = (N - P) \times \left(\frac{2T - U}{2T + U}\right) + P$$

P =previous damped value

N =new sensor value

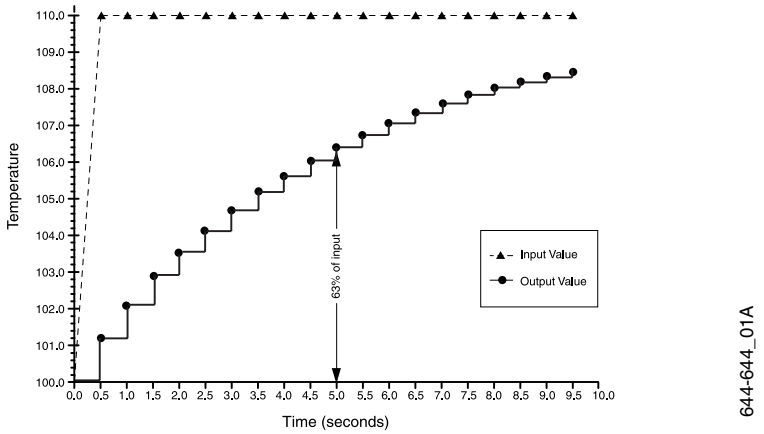
T = damping time constant

At the value to which the damping time constant is set, the transmitter output is at 63% of the input change and it continues to approach the input according to the damping equation above.

For example, as illustrated in Figure 3-2, if the temperature undergoes a step change—within 0.2% of the sensor limits—from 100 degrees to 110 degrees, and the damping is set to 5.0 seconds, the transmitter calculates and reports a new reading every 500 milliseconds using the damping equation. At 5.0 seconds, the transmitter outputs 106.3 degrees, or 63% of the input change, and the output continues to approach the input curve according to the equation above.

For information regarding the damping function when the input change is greater than 0.2% of the sensor limits, refer to “Intermittent Threshold” on page 3-16.

Figure 3-2. Change in Input vs. Change in Output with Damping Set to Five Seconds



AMS
Right click on the device and select “Configuration Properties” from the menu. Select the Snsr 1 tab and apply damping requirements.

Apply changes made (see “Apply AMS Changes” on page 3-6).

2-Wire RTD Offset

Fast Key Sequence	1, 3, 2, 1, 2, 1

The *2-Wire RTD Offset* command allows the user to input the measured lead wire resistance, which will result in the transmitter adjusting its temperature measurement to correct the error caused by this resistance. Due to a lack of lead wire compensation within the RTD, temperature measurement made with a 2-wire RTD are often inaccurate. See “Sensor Lead Wire Resistance Effect– RTD Input” on page 2-11 for more information.

To utilize this feature perform the following steps:

1. Measure the lead wire resistance of both RTD leads after installing the 2-wire RTD and the 644H.
2. From the HOME screen, select 1 *Device Setup*, *3 Configuration*, *2 Sensor Configuration, 1 Sensor 1, 2 Snsr 1 Setup,* and *1 2-Wire Offset*.
3. Enter the total measured resistance of the two RTD leads at the *2-Wire Offset* prompt. Enter this resistance as a negative (–) value to ensure proper adjustment.The transmitter then adjusts its temperature measurement to correct the error caused by lead wire resistance.

AMS
Right click on the device and select “Configuration Properties” from the menu. Select the Snsr 1 tab to configure the 2 Wire Offset.

Apply changes made (see “Apply AMS Changes” on page 3-6).

Information Variables

Access the transmitter information variables on-line using the HART Communicator or other suitable communications device. The following is a list of transmitter information variables. These variables include device identifiers, factory-set configuration variables, and other information. A description of each variable, the corresponding fast key sequence, and a review of its purposes are provided.

Tag

Fast Key Sequence	1, 3, 4, 1

The *Tag* variable is the easiest way to identify and distinguish between transmitters in multi-transmitter environments. Use it to label transmitters electronically according to the requirements of the application. The tag defined is automatically displayed when a HART Communicator establishes contact with the transmitter at power-up. The tag may be up to eight characters long and has no impact on the primary variable readings of the transmitter.

Date

Fast Key Sequence	1, 3, 4, 2

The *Date* command is a user-defined variable that provides a place to save the date of the last revision of configuration information. It has no impact on the operation of the transmitter or the HART Communicator.

Descriptor

Fast Key Sequence	1, 3, 4, 3

The *Descriptor* variable provides a longer user-defined electronic label to assist with more specific transmitter identification than is available with the tag variable. The descriptor may be up to 16 characters long and has no impact on the operation of the transmitter or the HART Communicator.

Message

Fast Key Sequence	1, 3, 4, 4

The *Message* variable provides the most specific user-defined means for identifying individual transmitters in multi-transmitter environments. It allows for 32 characters of information and is stored with the other configuration data. The message variable has no impact on the operation of the transmitter or the HART Communicator.

AMS

Right click on the device and select “Configuration Properties” from the menu. Select the Device tab to enter alphanumeric device information.

Apply changes made (see “Apply AMS Changes” on page 3-6).

Diagnostics and Service

Test Device

Fast Key Sequence	1, 2, 1

The *Test Device* command initiates a more extensive diagnostics routine than that performed continuously by the transmitter. The *Test Device* menu lists the following options:

- *1 Loop test* verifies the output of the transmitter, the integrity of the loop, and the operations of any recorders or similar devices installed in the loop. See “Loop Test” below for more information.
- *2 Self Test* initiates a transmitter self test. Error codes are displayed if there is a problem.
- *3 Master Reset* sends out a command that restarts and tests the transmitter. A master reset is like briefly powering down the transmitter. Configuration data remains unchanged after a master reset.
- *4 Status* lists error codes. **ON** indicates a problem, and **OFF** means there are no problems.

Loop Test

Fast Key Sequence	1, 2, 1, 1

The *Loop Test* command verifies the output of the transmitter, the integrity of the loop, and the operations of any recorders or similar devices installed in the loop. To initiate a loop test, perform the following procedure:

1. Connect a reference meter to the transmitter. To do so, shunt the transmitter power through the meter at some point in the loop.
2. 644H: From the **HOME** screen, select *1 Device Setup*, *2 Diag/Serv*, *1 Test Device*, *1 Loop Test* before performing a loop test.
   644 rail mount, select *1 Device Setup*, *2 Diagnostics and Service, 2 Loop Test*. Select **OK** after setting the control loop to manual. The communicator displays the loop test menu.
3. Select a discreet milliampere level for the transmitter to output. At the **CHOOSE ANALOG OUTPUT** prompt, select *1 4mA*, *2 20mA*, or select *3 other* to manually input a value between 4 and 20 mA.
4. Check the current meter installed in the test loop to verify that it reads the value that was commanded to output. If the readings do not match, either the transmitter requires an output trim or the current meter is malfunctioning.

After completing the test procedure, the display returns to the loop test screen and another output value can be chosen.

AMS

Right click and select “Diagnostics and Test.” Select “Loop Test.” The *loop test wizard* will walk through the process to fix the output for the sensor.

The transmitter must be returned to normal conditions (turn off loop test) before placing back in process

Right click and select “Diagnostics and Test.” Select “Loop Test.” The *loop test wizard* will walk through the process to fix the analog output. From the *loop test wizard* screen choose “END.” A message will appear indicating that it is OK to return to normal.

Master Reset

Fast Key Sequence	1, 2, 1, 3

Master Reset resets the electronics without actually powering down the unit. It does not return the transmitter to the original factory configuration.

AMS
Right click on the device and select “Diagnostics and Test” from the menu. Choose “Master Reset.”

The *wizard* will perform the reset.

Active Calibrator

Fast Key Sequence	1, 2, 2, 1, 3

The *Active Calibrator Mode* command enables or disables the pulsating current feature. The transmitter ordinarily operates with pulsating current so that sensor diagnostic functions, such as open sensor detection and EMF compensation, can be performed correctly. Some calibration equipment requires steady current to function properly. By enabling the Active Calibrator Mode the transmitter stops sending pulsating current to the sensor and supples a steady current. Disabling the Active Calibrator returns the transmitter to its normal operating state of sending a pulsating current to the sensor, thus enabling the sensor diagnostic functions.

The Active Calibrator Mode is volatile and will be automatically disabled when power is cycled or when a Master Reset is performed using the HART Communicator.

NOTE
The Active Calibrator Mode must be disabled before returning the transmitter to the process. This will ensure that the full diagnostic capabilities of the 644 are available.

Disabling or enabling the Active Calibrator Mode will not change any of the sensor trim values stored in the transmitter.

Sensor Review

Fast Key Sequence	1, 4, 2

The *Signal Condition* command allows viewing or changing the primary variable lower and upper range values, sensor percent of range, and sensor damping.

AMS
Right click on the device and select “Configuration Properties” from the menu. Select the Snsr 1 tab and review sensor configuration.

Apply changes made (see “Apply AMS Changes” on page 3-6).

Write Protect

Fast Key Sequence	1, 2, 3

The *Write Protect* command allows you to protect the transmitter configuration data from accidental or unwarranted changes. To enable the write protect feature, perform the following procedure:

1. From the **HOME** screen select *1 Device Setup*, *2 Diag/Service*, *3 Write Protect.*
2. Select *Enable WP.*

NOTE
To disable write protect on the 644, repeat the procedure, replacing *Enable WP* with *Disable WP*.

AMS
Right click on the device and select “Configuration Properties” from the menu. Select the Basic Setup tab and enable WP.

Apply changes made (see “Apply AMS Changes” on page 3-6).

HART Output

Fast Key Sequence	1, 3, 3, 3

The *HART Output* command allows the user to make changes to the multidrop address, specify the number of requested preambles, initiate burst mode, or make changes to the burst options.

AMS
Right click on the device and select “Configuration Properties” from the menu. Select the HART tab to configure HART multidrop addressing.

Apply changes made (see “Apply AMS Changes” on page 3-6).

Alarm and Saturation

Fast Key Sequence	1, 3, 3, 2

The *Alarm/Saturation* command allows the alarm settings (Hi or Low) and saturation values to be viewed and changed. To change the alarm values and saturation values, select the value to be changed, either *2 Low Alarm*, *3 High Alarm*, *4 Low Sat.*, or *5 High Sat*. Enter the desired new value, which must fall within the guidelines given below.

- The low alarm value must be between 3.30 and 3.75 mA
- The high alarm value must be between 21.0 and 23.0 mA
- The low saturation level must be between the low alarm value plus 0.1 mA and 3.9 mA.

Example: The low alarm value has been set to 3.7 mA. Therefore, the low saturation level, S, must be $3.8 \leq S \leq 3.9$ mA.

- The high saturation level must be between 20.5 mA and the high alarm value minus 0.1 mA.

Example: The high alarm value has been set to 20.8 mA. Therefore, the low saturation level, S, must be $20.5 \leq S \leq 20.7$ mA.

AMS
For AMS, configure the sensor as indicated above.

Right click on the device and select “Configuration Properties” from the menu. Select the Analog Output tab to define the alarm and saturation levels. From the Alarm box, enter the low and high alarm and the low and high saturation.

Apply changes made (see “Apply AMS Changes” on page 3-6).

Rerange

Reranging the transmitter sets the measurement range to the limits of expected readings. Setting the measurement range to the limits of expected readings maximizes transmitter performance; the transmitter is most accurate when operated within the expected temperature range for your application.

PV Range Values

Fast Key Sequence	1, 3, 3, 1

The *PV URV* and *PV LRV* commands, found in the *PV Range Values* menu screen, allow the user to set the transmitter’s lower and upper range values using limits of expected readings. The range of expected readings is defined by the Lower Range Value (LRV) and Upper Range Value (URV). The transmitter range values can be reset as often as necessary to reflect changing process conditions. From the *PV Range Values* screen select *1 PV LRV* to change the lower range value and *2 PV URV* to change the upper range value.

NOTE:
The rerange functions should not be confused with the trim functions. Although the rerange command matches a sensor input to a 4–20 mA output, as in conventional calibration, it does not affect the transmitter’s interpretation of the input.

AMS
Right click on the device and select “Configuration Properties” from the menu. Select the Basic Setup tab and set the URV and LRV.

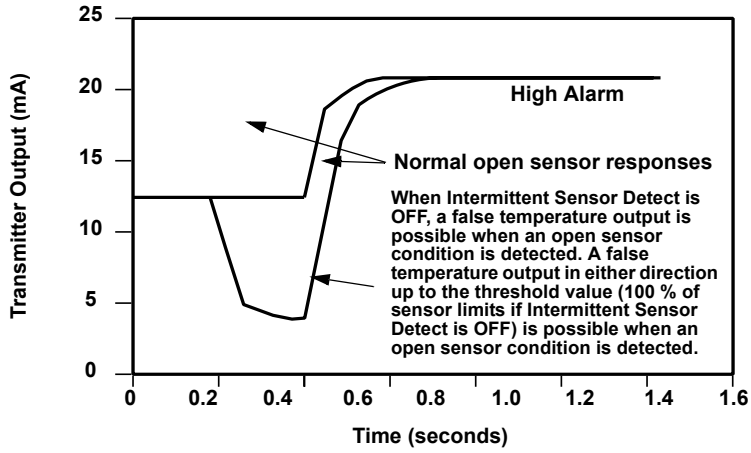
Apply changes made (see “Apply AMS Changes” on page 3-6).

Intermittent Threshold

Fast Key Sequence	1, 3, 5, 4

The threshold value can be changed from the default value of 2%. Turning the Intermittent Sensor Detect feature **OFF** or leaving it **ON** and increasing the threshold value above the default does not affect the time needed for the transmitter to output the correct alarm signal after detecting a true open sensor condition. However, the transmitter may briefly output a false temperature reading for up to one update in either direction (see Figure 3-4 on page 3-18) up to the threshold value (100% of sensor limits if Intermittent Sensor Detect is **OFF)**. Unless rapid response rate is necessary, the suggested setting of the Intermittent Sensor Detect mechanism is **ON** with 2% threshold.

Figure 3-3. Open Sensor Response



Intermittent Sensor Detect (Advanced Feature)

The Intermittent Sensor Detect feature is designed to guard against process temperature readings caused by intermittent open sensor conditions (an *intermittent* sensor condition is an open sensor condition that lasts less than one update). By default, the transmitter is shipped with the Intermittent Sensor Detect feature switched **ON** and the threshold value set at 2% of sensor limits. The Intermittent Sensor Detect feature can be switched **ON** or **OFF** and the threshold value can be changed to any value between 0 and 100% of the sensor limits with a HART communicator.

Transmitter Behavior with Intermittent Sensor Detect ON

When the Intermittent Sensor Detect feature is switched **ON**, the transmitter can eliminate the output pulse caused by intermittent open sensor conditions. Process temperature changes (ΔT) within the threshold value will be tracked normally by the transmitter's output. A ΔT greater than the threshold value will activate the intermittent sensor algorithm. True open sensor conditions will cause the transmitter to go into alarm.

The threshold value of the 644 should be set at a level that allows the normal range of process temperature fluctuations; too high and the algorithm will not be able to filter out intermittent conditions; too low and the algorithm will be activated unnecessarily. The default threshold value is 2% of the sensor limits.

Transmitter Behavior with Intermittent Sensor Detect OFF

When the Intermittent Sensor Detect feature is switched **OFF**, the transmitter tracks all process temperature changes, even if they are the consequence of an intermittent sensor. (The transmitter in effect behaves as though the threshold value had been set at 100%.) The output delay due to the intermittent sensor algorithm will be eliminated.

AMS

Right click on the device and select "Configuration Properties" from the menu. Select the Electronics tab. From the Measurement Filtering Box, configure the Intermit threshold.

Apply changes made (see "Apply AMS Changes" on page 3-6).

Open Sensor Holdoff

Fast Key Sequence	1, 3, 5, 3

The *Open Sensor Holdoff* option, at the normal setting, enables the 644 to be more robust under heavy EMI conditions. This is accomplished through the software by having the transmitter perform additional verification of the open sensor status prior to activating the transmitter alarm. If the additional verification shows that the open sensor condition is not valid, the transmitter will not go into alarm.

For users of the 644 that desire a more vigorous open sensor detection, the Open Sensor Holdoff option can be changed to a fast setting. With this setting, the transmitter will report an open sensor condition without additional verification of the open condition.

AMS
Right click on the device and select “Configuration Properties” from the menu. Select the Electronics tab. From the Measurement Filtering Box box, configure the Open Snsr Holdoff.

Apply changes made (see “Apply AMS Changes” on page 3-6).

MULTIDROP COMMUNICATION

Multidropping refers to the connection of several transmitters to a single communications transmission line. Communication between the host and the transmitters takes place digitally with the analog output of the transmitters deactivated.

Many Rosemount transmitters can be multidropped. With the HART communications protocol, up to 15 transmitters can be connected on a single twisted pair of wires or over leased phone lines.

A HART Communicator can test, configure, and format a multidropped 644 transmitter in the same way as in a standard point-to-point installation.

The application of a multidrop installation requires consideration of the update rate necessary from each transmitter, the combination of transmitter models, and the length of the transmission line. Each transmitter is identified by a unique address (1–15) and responds to the commands defined in the HART protocol.

Figure 3-4. Typical Multidropped Network

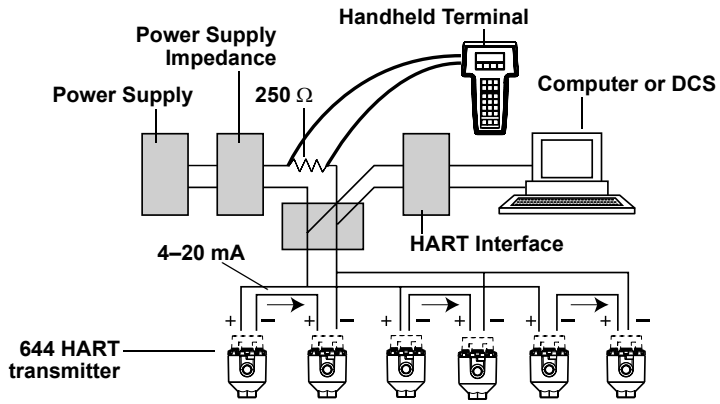


Figure 3-4 shows a typical multidrop network. Do not use this figure as an installation diagram. Contact Emerson Process Management product support with specific requirements for multidrop applications.

NOTE
644 transmitters are set to address 0 at the factory, allowing them to operate in the standard point-to-point manner with a 4–20 mA output signal. To activate multidrop communication, the transmitter address must be changed to a number between 1 and 15. This change deactivates the 4–20 mA analog output, sending it to 4 mA. The failure mode current also is disabled.

AMS
Right click and select “Configuration Properties” from the menu screen. Select the “HART” tab. From here, assign the polling address.

OPERATION AND MAINTENANCE

Calibration

Calibrating the transmitter increases the measurement precision by allowing corrections to be made to the factory-stored characterization curve by digitally altering the transmitter’s interpretation of the sensor input.

To understand calibration, it is necessary to understand that smart transmitters operate differently from analog transmitters. An important difference is that smart transmitters are factory-characterized, meaning that they are shipped with a standard sensor curve stored in the transmitter firmware. In operation, the transmitter uses this information to produce a process variable output, in engineering units, dependent on the sensor input.

Calibration of the 644 may include the following procedures:

- Sensor Input Trim: digitally alter the transmitter’s interpretation of the input signal
- Transmitter Sensor Matching: generates a special custom curve to match that specific sensor curve, as derived from the Callendar-Van Dusen constants
- Output Trim: calibrates the transmitter to a 4–20 mA reference scale
- Scaled Output Trim: calibrates the transmitter to a user-selectable reference scale.

Trim the Transmitter

One or more of the trim functions may be used when calibrating. The trim functions are as follows

- Sensor Input Trim
- Transmitter Sensor Matching
- Output Trim
- Output Scaled Trim

Sensor Input Trim

Fast Key Sequence	1, 2, 2, 1, 1

Perform a sensor trim if the transmitters digital value for the primary variable does not match the plant's standard calibration equipment. The sensor trim function calibrates the sensor to the transmitter in temperature units or raw units. Unless your site-standard input source is NIST-traceable, the trim functions will not maintain the NIST-traceability of the system.

The *Sensor Input Trim* command allows the transmitter's interpretation of the input signal to be digitally altered (see Figure 3-5). The sensor reference command trims, in engineering (F, °C, °R, K) or raw (Ω, mV) units, the combined sensor and transmitter system to a site standard using a known temperature source. Sensor trimming is suitable for validation procedures or for applications that require calibrating the sensor and transmitter together.

Use the following procedure to perform a sensor trim with a 644H.

1. Connect the calibration device or sensor to the transmitter. Refer to Figure 2-9 on page 2-11 or inside of the transmitter terminal side cover for sensor wiring diagrams. (If using an active calibrator, please see "Active Calibrator" on page 3-14)
2. Connect the communicator to the transmitter loop.
3. From the Home screen, select *1 Device Setup*, *2 Diag/Service*, *2 Calibration*, *1 Sensor 1 Trim*, *1 Sensor 1 Input Trim* to prepare to trim the sensor.
4. Set the control loop to manual and select **OK**.
5. Select the appropriate sensor trim units at the **ENTER SNSR 1 TRIM UNITS** prompt.
6. Select *1 Lower Only* or *2 Lower and Upper* at the **SELECT SENSOR TRIM POINTS** prompt.
7. Adjust the calibration device to the desired trim value (must be within the selected sensor limits). If a combined sensor and transmitter system are being trimmed, expose the sensor to a known temperature and allow the temperature reading to stabilize. Use a bath, furnace or isothermal block, measured with a site-standard thermometer, as the known temperature source.
8. Select **OK** once the temperature stabilizes. The communicator displays the output value the transmitter associates with the input value provided by the calibration device.
9. Enter the lower or upper trim point, depending on the selection in Step 6.

AMS
For AMS, configure the sensor as indicated above.

Right click on the device and select "Calibrate" from the menu. Select "Sensor 1 Trim," then "Sensor Input Trim."

The *wizard* will continue through the process.

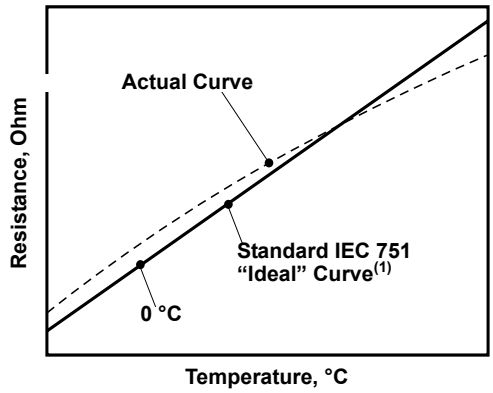
The transmitter may be restored to the factory default by selecting: "Calibration," "Sensor 1 Trim," "Revert to Factory Trim."

The *wizard* will recall the factory trim for a given sensor

Apply changes made (see “AMS” on page 3-5).

Transmitter-Sensor Matching
Perform the *Transmitter Sensor Matching* procedure to enhance the temperature measurement accuracy of the system (see the comparison below) and if you have a sensor with Callendar-Van Dusen constants. When ordered from Emerson Process Management, sensors with Callendar-Van Dusen constants are NIST-traceable.

The 644 accepts Callendar-Van Dusen constants from a calibrated RTD schedule and generates the actual curve to match that specific sensor curve.



(1) The Actual Curve is identified from the Callendar-Van Dusen equation.

System Accuracy Comparison at 150 °C Using a PT 100 (α=0.00385) RTD with a Span of 0 to 200 °C			
Standard RTD		Matched RTD	
644H	±0.15 °C	644H	±0.15 °C
Standard RTD	±1.05 °C	Matched RTD	±0.18 °C
Total System(1)	±1.06 °C	Total System(1)	±0.23 °C

(1) Calculated using root-summed-squared (RSS) statistical method

$$\text{TotalSystemAccuracy} = \sqrt{(\text{TransmitterAccuracy})^2 + (\text{SensorAccuracy})^2}$$

Callendar-Van Dusen equation:

$$R_t = R_o + R_o\alpha\,[t - \delta(0.01t-1)(0.01t) - \beta(0.01t - 1)(0.01t)^3]$$

The following input variables, included with specially-ordered Rosemount temperature sensors, are required:

R_0 = Resistance at Ice Point
Alpha = Sensor Specific Constant
Beta = Sensor Specific Constant
Delta = Sensor Specific Constant

To input Callendar-Van Dusen constants, perform the following procedure:

1. From the **HOME** screen, select *1 Device Setup*, *3 Configuration*, *2 Sensor Config*, *1 Chng Type/Conn*, *1 Sensor 1* or *2 Sensor 2.* Set the control loop to manual and select **OK**.
2. Select *Cal VanDusen* at the **ENTER SENSOR TYPE** prompt.
3. Select the appropriate number of wires at the **ENTER SENSOR CONNECTION** prompt.
4. Enter the R_o, Alpha, Delta, and Beta values from the stainless steel tag attached to the special-order sensor when prompted.
5. Return the control loop to automatic control and select **OK**.

To disable the transmitter-sensor matching feature from the **HOME** screen select *1 Device Setup*, *3 Configuration*, *2 Sensor Confi*g, *1 Chng Type/Conn*, *1 Sensor 1* or *2 Sensor 2*. Choose the appropriate sensor type from the **ENTER SENSOR TYPE** prompt.

NOTE
When the transmitter-sensor matching is disabled, the transmitter reverts to either user or factory trim, whichever was used previously. Make certain the transmitter engineering units default correctly before placing the transmitter into service.

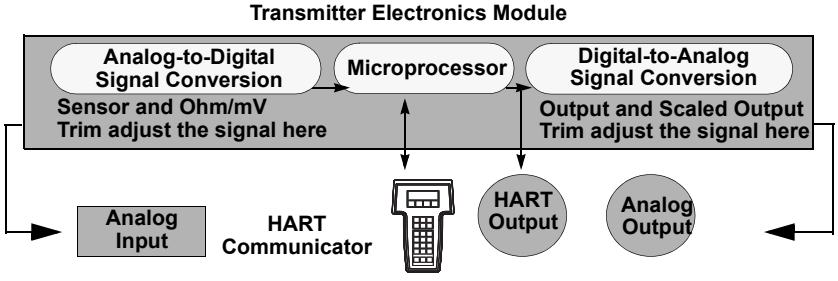
AMS
Right click on the device and select “Sensor Connections” from the menu. Select the “Sensor 1 Config.” Select “Sensor Connections.”

The *wizard* will go through the required changes.

NOTE
Under “Enter Sensor Type” select “Cal VanDusen.

Output Trim or Scaled Output Trim
Perform an output trim or a scaled output trim if the digital value for the primary variable matches the plant’s standards but the transmitter’s analog output does not match the reading on the output device. The output trim function calibrates the transmitter to a 4–20 mA reference scale; the scaled output trim function calibrates to a user-selectable reference scale. To determine the need for an output trim or a scaled output trim, perform a loop test (see “Loop Test” on page 3-13).

Figure 3-5. Dynamics of Smart Temperature Measurement



Output Trim

Fast Key Sequence	1, 2, 2, 2

The *D/A Trim* command allows the transmitter's conversion of the input signal to a 4–20 mA output to be altered (see Figure 3-5 on page 3-22). Adjust the analog output signal at regular intervals to maintain measurement precision. To perform a digital-to-analog trim, perform the following procedure:

1. From the **HOME** screen, select *1 Device setup*, *2 Diag/Service*, *2 Calibration*, *2 D/A trim*. Set the control loop to manual and select **OK**.
2. Connect an accurate reference meter to the transmitter at the **CONNECT REFERENCE METER** prompt. To do so, shunt the power to the transmitter through the reference meter at some point in the loop. Select **OK** after connecting the reference meter.
3. Select **OK** at the **SETTING FLD DEV OUTPUT TO 4 MA** prompt. The transmitter outputs 4.00 mA.
4. Record the actual value from the reference meter, and enter it at the **ENTER METER VALUE** prompt. The communicator prompts the user to verify whether or not the output value equals the value on the reference meter.
5. If the reference meter value equals the transmitter output value, then select *1 Yes* and go to step 6. If the reference meter value does not equal the transmitter output value, then select *2 No* and go to step 4.
6. Select **OK** at the **SETTING FLD DEV OUTPUT TO 20 MA** prompt and repeat steps 4 and 5 until the reference meter value equals the transmitter output value.
7. Return the control loop to automatic control and select **OK**.

AMS
Right click on the device and select "Calibrate" from the menu. Select "D/A Trim."

This *wizard* will go through the required changes.

Scaled Output Trim

Fast Key Sequence	1, 2, 2, 3

The *Scaled D/A Trim* command matches the 4 and 20 mA points to a user-selectable reference scale other than 4 and 20 mA (2–10 volts, for example). To perform a scaled D/A trim, connect an accurate reference meter to the transmitter and trim the output signal to scale as outlined in the "Output Trim" procedure.

AMS
Right click on the device and select "Calibrate" from the menu. Select "Scaled D/A Trim."

This *wizard* will go through the required changes.

Hardware

Maintenance

The 644H has no moving parts and requires minimal scheduled maintenance.

Sensor Checkout

⚠ To determine whether the sensor is at fault, replace it with another sensor or connect a test sensor locally at the transmitter to test remote sensor wiring. Select any standard, off-the-shelf sensor for use with a 644, or consult the factory for a replacement special sensor and transmitter combination.

Diagnostic Messages

Hardware

⚠ If a malfunction is suspected despite the absence of diagnostics messages on the HART Communicator or AMS display, follow the procedures described in Table 3-2 to verify that transmitter hardware and process connections are in good working order. Under each of four major symptoms, specific suggestions are offered for solving the problem.

Table 3-2. 644H Troubleshooting Chart

Symptom	Potential Source	Corrective Action
Transmitter Does Not Communicate with HART Communicator	Loop Wiring	• Check the revision level of the transmitter device descriptors (DDs) stored in the communicator. The communicator should report Dev v6, DD v1. • Check for a minimum of 250 ohms resistance between the power supply and HART Communicator connection. • Check for adequate voltage to the transmitter. If a HART Communicator is connected and 250 ohms resistance is in the loop, the transmitter requires a minimum of 12.0 V at the terminals to operate (over entire 3.75 to 23 mA operating range). • Check for intermittent shorts, open circuits, and multiple grounds. • Specify the transmitter by tag number. For certain non-standard transmitter installations, it may be necessary, because of excessive line length, to specify the transmitter tag number to initiate communications.
High Output	Sensor Input Failure or Connection	• Connect a HART Communicator and enter the transmitter test mode to isolate a sensor failure. • Check for a sensor open or short circuit. • Check the process variable to see if it is out of range.
	Loop Wiring	• Check for dirty or defective terminals, interconnecting pins, or receptacles.
	Power Supply	• Check the output voltage of the power supply at the transmitter terminals. It should be 12.0 to 42.4 V dc (over entire 3.75 to 23 mA operating range).
	Electronics Module	• Connect a HART Communicator and enter the transmitter status mode to isolate module failure. • Connect a HART Communicator and check the sensor limits to ensure calibration adjustments are within the sensor range.
Erratic Output	Loop Wiring	• Check for adequate voltage to the transmitter. It should be 12.0 to 42.4 V dc at the transmitter terminals (over entire 3.75 to 23 mA operating range). • Check for intermittent shorts, open circuits, and multiple grounds. • Connect a HART Communicator and enter the Loop test mode to generate signals of 4 mA, 20 mA, and user-selected values.
	Electronics Module	• Connect a HART Communicator and enter the transmitter test mode to isolate module failure.

Symptom	Potential Source	Corrective Action
Low Output or No Output	Sensor Element	• Connect a HART Communicator and enter the Transmitter test mode to isolate a sensor failure. • Check the process variable to see if it is out of range.
	Loop Wiring	• Check for adequate voltage to the transmitter. It should be 12.0 to 42.4 V dc (over entire 3.75 to 23 mA operating range). • Check for shorts and multiple grounds. • Check for proper polarity at the signal terminal. • Check the loop impedance. • Connect a HART Communicator and enter the Loop test mode. • Check wire insulation to detect possible shorts to ground.
	Electronics Module	• Connect a HART Communicator and check the sensor limits to ensure calibration adjustments are within the sensor range. • Connect a HART Communicator and enter the Transmitter test mode to isolate an electronics module failure.

HART Communicator

Table 3-3 provides a guide to diagnostic messages used by the HART Communicator.

Variable parameters within the text of a message are indicated with the notation <*variable parameter*>. Reference to the name of another message is identified by the notation *[another message]*.

Table 3-3. HART Diagnostics Messages

Message	Description
Add item for ALL device types or only for this ONE device type	Asks the user whether the hot key item being added should be added for all device types or only for the type of device that is connected.
Command Not Implemented	The connected device does not support this function.
Communication Error	Either a device sends back a response indicating that the message it received was unintelligible, or the HART Communicator cannot understand the response from the device.
Configuration memory not compatible with connected device	The configuration stored in memory is incompatible with the device to which a transfer has been requested.
Device Busy	The connected device is busy performing another task.
Device Disconnected	Device fails to respond to a command.
Device write protected	Device is in write-protect mode. Data can not be written.
Device write protected. Do you still want to shut off?	Device is in write-protect mode. Press YES to turn the HART Communicator off and lose the unsent data.
Display value of variable on hotkey menu?	Asks whether the value of the variable should be displayed adjacent to its label on the hotkey menu if the item being added to the hotkey menu is a variable.
Download data from configuration memory to device	Prompts user to press SEND softkey to initiate a memory to device transfer.
Exceed field width	Indicates that the field width for the current arithmetic variable exceeds the device- specified description edit format.
Exceed precision	Indicates that the precision for the current arithmetic variable exceeds the device- specified description edit format.
Ignore next 50 occurrences of status?	Asked after displaying device status. Softkey answer determines whether next 50 occurrences of device status will be ignored or displayed.
Illegal character	An invalid character for the variable type was entered.
Illegal date	The day portion of the date is invalid.
Illegal month	The month portion of the date is invalid.
Illegal year	The year portion of the date is invalid.
Incomplete exponent	The exponent of a scientific notation floating point variable is incomplete.
Incomplete field	The value entered is not complete for the variable type.
Looking for a device	Polling for multidropped devices at addresses 1–15.
Mark as read only variable on hotkey menu?	Asks whether the user should be allowed to edit the variable from the hotkey menu if the item being added to the hotkey menu is a variable.
No device configuration in configuration memory	There is no configuration saved in memory available to re-configure off-line or transfer to a device.
No Device Found	Poll of address zero fails to find a device, or poll of all addresses fails to find a device if auto-poll is enabled.
No hotkey menu available for this device.	There is no menu named “hotkey” defined in the device description for this device.
No offline devices available.	There are no device descriptions available to be used to configure a device offline.
No simulation devices available.	There are no device descriptions available to simulate a device.
No UPLOAD_VARIABLES in ddl for this device	There is no menu named “upload_variables” defined in the device description for this device. This menu is required for offline configuration.
No Valid Items	The selected menu or edit display contains no valid items.
OFF KEY DISABLED	Appears when the user attempts to turn the HART Communicator off before sending modified data or before completing a method.
Online device disconnected with unsent data. RETRY or OK to lose data.	There is unsent data for a previously connected device. Press RETRY to send data, or press OK to disconnect and lose unsent data.

Message	Description
Out of memory for hotkey configuration. Delete unnecessary items.	There is no more memory available to store additional hotkey items. Unnecessary items should be deleted to make space available.
Overwrite existing configuration memory	Requests permission to overwrite existing configuration either by a device-to-memory transfer or by an offline configuration. User answers using the softkeys.
Press OK.	Press the OK softkey. This message usually appears after an error message from the application or as a result of HART communications.
Restore device value?	The edited value that was sent to a device was not properly implemented. Restoring the device value returns the variable to its original value.
Save data from device to configuration memory	Prompts user to press SAVE softkey to initiate a device-to-memory transfer.
Saving data to configuration memory.	Data is being transferred from a device to configuration memory.
Sending data to device.	Data is being transferred from configuration memory to a device.
There are write only variables which have not been edited. Please edit them.	There are write-only variables which have not been set by the user. These variables should be set or invalid values may be sent to the device.
There is unsent data. Send it before shutting off?	Press YES to send unsent data and turn the HART Communicator off. Press NO to turn the HART Communicator off and lose the unsent data.
Too few data bytes received	Command returns fewer data bytes than expected as determined by the device description.
Transmitter Fault	Device returns a command response indicating a fault with the connected device.
Units for <variable label> has changed. Unit must be sent before editing, or invalid data will be sent.	The engineering units for this variable have been edited. Send engineering units to the device before editing this variable.
Unsent data to online device. SEND or LOSE data	There is unsent data for a previously connected device which must be sent or thrown away before connecting to another device.
Use up/down arrows to change contrast. Press DONE when done.	Gives direction to change the contrast of the HART Communicator display.
Value out of range	The user-entered value is either not within the range for the given type and size of variable or not within the min/max specified by the device.
<message> occurred reading/writing <variable label>	Either a read/write command indicates too few data bytes received, transmitter fault, invalid response code, invalid response command, invalid reply data field, or failed pre- or post-read method; or a response code of any class other than SUCCESS is returned reading a particular variable.
<variable label> has an unknown value. Unit must be sent before editing, or invalid data will be sent.	A variable related to this variable has been edited. Send related variable to the device before editing this variable.

AMS Software

The following is a list of messages used by AMS software. These are communicated through pop-up menus.

Message	Description
Command not implemented	The connected device does not support this function.
Communication error	Either a device sends back a response indicating that the message it received was unintelligible, or the HART Communicator cannot understand the response from the device.
Device busy	The connected device is busy performing another task.
Device disappears from list	Device fails to respond to a command.
Device write protected	Device is in write-protect mode. Data can not be written.
Illegal character	An invalid character for the variable type was entered.
Illegal date	The day portion of the date is invalid.
Illegal month	The month portion of the date is invalid.
Illegal year	The year portion of the date is invalid.
Incomplete exponent	The exponent of a scientific notation floating point variable is incomplete.
Incomplete field	The value entered is not complete for the variable type.
Sending data to device	Data is being transferred from configuration memory to a device.
There are write only variables which have not been edited. Please edit them	There are write-only variables that have not been set by the user. These variables should be set or invalid values may be sent to the device.
There is unsent data. Send it before shutting off?	Press YES to send unsent data and turn the HART Communicator off. Press NO to turn the HART Communicator off and lose the unsent data.
Too few data bytes received	Command returns fewer data bytes than expected as determined by the device description.
Transmitter fault	Device returns a command response indicating a fault with the connected device.
Units for <variable label> has changed. Unit must be sent before editing, or invalid data will be sent.	The engineering units for this variable have been edited. Send engineering units to the device before editing this variable.
Unsent data to online device. SEND or LOSE data	There is unsent data for a previously connected device which must be sent or thrown away before connecting to another device.
Value out of range	The user-entered value is either not within the range for the given type and size of variable or not within the min/max specified by the device.
<message> occurred reading/writing <variable label>	Either a read/write command indicates too few data bytes received, transmitter fault, invalid response code, invalid response command, invalid reply data field, or failed pre- or post-read method; or a response code of any class other than SUCCESS is returned reading a particular variable.
<variable label> has an unknown value. Unit must be sent before editing, or invalid data will be sent.	A variable related to this variable has been edited. Send related variable to the device before editing this variable.

LCD Display

The LCD display displays abbreviated diagnostic messages for troubleshooting the transmitter. To determine the cause of a message, use a HART Communicator to further interrogate the transmitter. A description of each diagnostic message is identified in Table 3-4. The device sometimes requires additional interrogation to determine the source of the warning. Contact Emerson Process Management Customer Central at (800) 999-9307 for further information.

Table 3-4. LCD Display Diagnostics

ALARM	Description
DEV FAIL	The top line of the display scrolls through the following three messages: • “BAD” • “DEV” • “FAIL” This message indicates one of several conditions. For example, the transmitter may have experienced an electronics failure while attempting to store information. If diagnostics indicate an electronics failure, replace the transmitter with a new one. Contact the nearest Emerson Process Management Field Service Center if necessary.
SNSR FAIL	The top line of the display scrolls through the following three messages: • “BAD” • “SNSR” • “FAIL” The bottom line display s the name of the sensor that has failed. This message indicates that the transmitter has detected an open or shorted sensor condition. The sensor may be disconnected, connected improperly, or malfunctioning. Check the sensor connections and sensor continuity.
UNCRN	The top line of the display alternates between “UNCRN” and the sensor value. The bottom line will display the name of the sensor for which this message applies. The uncertain message is displayed when the sensor reading is outside of the acceptable temperature range for the particular sensor type.
FIXED	During a loop test or a a 4–20 mA output trim, the analog output defaults to a fixed value. The top line of the display alternates between “FIXED” and the amount of current selected in milliamperes. The bottom line will hold on “AO mA.”
OFLOW	The location of the decimal point, as configured in the meter setup, is not compatible wit the value to be displayed by the meter. For example, if the meter is measuring a process temperature greater than 9.9999 degrees and the meter decimal point is set to 4-digit precision, the meter will display an “OFLOW” message because it is only capable of displaying a maximum of 9.9999 when set to 4-digit precision.
ALARM	When a failure occurs and the meter is configured to display Primary Variable Percent of Range and/or Analog Output, the top line o the meter will display “ALARM.” This indicates that the transmitter is in failure mode.
SAT	When the transmitter output saturates and the meter is configured to display Primary Variable Percent of Range and/or Analog Output, the top line of the meter will display “SAT.” This indicates that the transmitter output has reached saturation level.

Safety Messages . . . . . **page 4-1**
General Block Information . . . . . **page 4-2**
Foundation fieldbus function blocks . . . . . **page 4-4**
Operation and Maintenance . . . . . **page 4-14**

OVERVIEW

This section provides information on configuring, troubleshooting, operating, and maintaining the Rosemount 644 Temperature transmitter using FOUNDATION fieldbus protocol.

SAFETY MESSAGES

Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that potentially raises safety issues is indicated by a warning symbol (⚠). Please refer to the following safety messages before performing an operation preceded by this symbol.

Warnings

⚠WARNING

Failure to follow these installation guidelines could result in death or serious injury.

- Make sure only qualified personnel perform the installation.

Explosions could result in death or serious injury.

- Do not remove the connection head cover in explosive atmospheres when the circuit is live.
- Before powering a FOUNDATION fieldbus segment in an explosive atmosphere, make sure the instruments in the loop are installed in accordance with instrinsically safe or non-incendive field wiring practices.
- Verify that the operating atmosphere of the transmitter is consistent with the appropriate hazardous locations certifications.
- All connection head covers must be fully engaged to meet explosion-proof requirements.

Process leaks could result in death or serious injury.

- Do not remove the thermowell while in operation.
- Install and tighten thermowells and sensors before applying pressure

Electrical shock could cause death or serious injury.

- Use extreme caution when making contact with the leads and terminals.

GENERAL BLOCK INFORMATION

Device Description

Before configuring the device, ensure the host has the appropriate Device Description file revision for this device. The device descriptor can be found on www.rosemount.com. The initial release of the Rosemount 644 with FOUNDATION fieldbus protocol is device revision 1.

Node Address

The transmitter is shipped at a temporary (248) address. This will enable FOUNDATION fieldbus host systems to automatically recognize the device and move it to a permanent address.

Modes

The Resource, Transducer, and all function blocks in the device have modes of operation. These modes govern the operation of the block. Every block supports both automatic (AUTO) and out of service (OOS) modes. Other modes may also be supported.

⚠ Changing Modes

To change the operating mode, set the MODE_BLK.TARGET to the desired mode. After a short delay, the parameter MODE_BLOCK.ACTUAL should reflect the mode change if the block is operating properly.

Permitted Modes

It is possible to prevent unauthorized changes to the operating mode of a block. To do this, configure MODE_BLOCK.PERMITTED to allow only the desired operating modes. It is recommended to always select OOS as one of the permitted modes.

Types of Modes

For the procedures described in this manual, it will be helpful to understand the following modes:

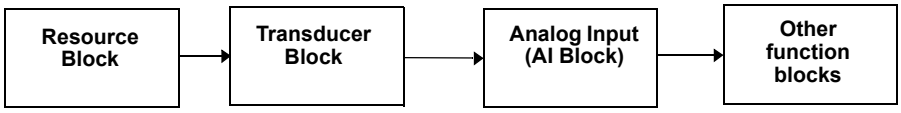
AUTO
The functions performed by the block will execute. If the block has any outputs, these will continue to update. This is typically the normal operating mode.

Out of Service (OOS)
The functions performed by the block will not execute. If the block has any outputs, these will typically not update and the status of any values passed to downstream blocks will be “BAD”. To make some changes to the configuration of the block, change the mode of the block to OOS. When the changes are complete, change the mode back to AUTO.

MAN
In this mode, variables that are passed out of the block can be manually set for testing or override purposes.

Other Types of Modes
Other types of modes are Cas, RCas, ROut, IMan and LO. Some of these may be supported by different function blocks in the 644. For more information, see the Function Block manual (document number 00809-0100-4783).

NOTE
When an upstream block is set to OOS, this will impact the output status of all downstream blocks. The figure below depicts the hierarchy of blocks:



Link Active Scheduler

The 644 can be designated to act as the backup Link Active Scheduler (LAS) in the event that the designated LAS is disconnected from the segment. As the backup LAS, the 644 will take over the management of communications until the host is restored.

The host system may provide a configuration tool specifically designed to designate a particular device as a backup LAS. Otherwise, this can be configured manually as follows:

⚠
1. Access the Management Information Base (MIB) for the 644. To activate the LAS capability, write 0x02 to the BOOT_OPERAT_FUNCTIONAL_CLASS object (Index 605). To deactivate, write 0x01.
2. Restart the device.

Block Installation

Rosemount devices are pre-configured with function blocks at the factory, the default permanent configuration for the 644 is listed below. The 644 can have up to ten additional instantiated function blocks.

- 2 Analog Input Blocks (tag names AI 1300, AI 1400)
- 1 Proportional/Integral/Derivative Block (tag name PID 1500)

The 644 supports the use of Function Block Instantiation. When a device supports block instantiation, the number of blocks and block types can be defined to match specific application needs.The number of blocks that can be instantiated is only limited by the amount of memory within the device and the block types that are supported by the device. Instantiation does not apply to standard device blocks like the Resource, Sensor Transducer, LCD Transducer, and Advanced Diagnostics Blocks.

By reading the parameter “FREE_SPACE” in the Resource block you can determine how many blocks you can instantiate. Each block that you instantiate takes up 4.5% of the “FREE_SPACE”.

Block instantiation is done by the host control system or configuration tool, but not all hosts are required to implement this functionality. Please refer to your specific host or configuration tool manual for more information.

Capabilities

Virtual Communication Relationship (VCRs)

There are a total of 12 VCRs. One is permanent and 11 are fully configurable by the host system. Sixteen link objects are available.

Network Parameter	Value
Slot Time	8
Maximum Response Delay	2
Maximum Inactivity to Claim LAS Delay	32
Minimum Inter DLPDU Delay	8
Time Sync class	4 (1ms)
Maximum Scheduling Overhead	21
Per CLPDU PhL Overhead	4
Maximum Inter-channel Signal Skew	0
Required Number of Post-transmission-gab-ext Units	0
Required Number of Preamble-extension Units	1

Block Execution times

Analog Input = 45 ms
PID = 60 ms

FOUNDATION FIELDBUS FUNCTION BLOCKS

For reference information on the Resource, Sensor Transducer, AI, LCD Transducer blocks refer to “Foundation Fieldbus Block Information” on page A-1. Reference information on the PID block can be found in the Function Block manual document number 00809-0100-4783.

Resource Block (index number 1000)

The Resource Function Block (RB) contains diagnostic, hardware and electronics information. There are no linkable inputs or outputs to the Resource Block.

Sensor Transducer Block (index number 1100)

The Sensor Transducer Function Block (STB) temperature measurement data, including sensor and terminal temperature, The STB also includes information about sensor type, engineering units, linearization, reranging, damping, temperature compensation, and diagnostics.

LCD Transducer Block (index number 1200)

The LCD Transducer Block is used to configure the LCD meter.

Analog Input Block (index number 1300 and 1400)

The Analog Input Function Block (AI) processes the measurements from the sensor and makes them available to other function blocks. The output value from the AI block is in engineering units and contains a status indicating the quality of the measurement. The AI block is widely used for scaling functionality.

PID Block (index number 1500)

The PID Function Block combines all of the necessary logic to perform proportional/integral/derivative (PID) control. The block supports mode control, signal scaling and limiting, feed forward control, override tracking, alarm limit detection, and signal status propagation.

The block supports two forms of the PID equation: Standard and Series. You can choose the appropriate equation using the MATHFORM parameter. The Standard ISA PID equation is the default selection.

Resource Block

FEATURES and FEATURES_SEL

The parameters FEATURES and FEATURE_SEL determine optional behavior of the 644.

FEATURES
The FEATURES parameter is read only and defines which features are supported by the 644. Below is a list of the FEATURES the 644 supports.

UNICODE
All configurable string variables in the 644, except tag names, are octet strings. Either ASCII or Unicode may be used. If the configuration device is generating Unicode octet strings, you must set the Unicode option bit.

REPORTS
The 644 supports alert reports. The Reports option bit must be set in the features bit string to use this feature. If it is not set, the host must poll for alerts.

SOFT W LOCK
Inputs to the security and write lock functions include the software write lock bits of the FEATURE_SEL parameter, the WRITE_LOCK parameter, and the DEFINE_WRITE_LOCK parameter.

The WRITE_LOCK parameter prevents modification of parameters within the device except to clear the WRITE_LOCK parameter. During this time, the block will function normally updating inputs and outputs and executing algorithms. When the WRITE_LOCK condition is cleared, a WRITE_ALM alert is generated with a priority that corresponds to the WRITE_PRI parameter.

The FEATURE_SEL parameter enables the user to select the software write lock or no write lock capability. In order to enable the software write lock, the SOFT_W_LOCK bit must be set in the FEATURE_SEL parameter. Once this bit is set, the WRITE_LOCK parameter may be set to “Locked” or “Unlocked.” Once the WRITE_LOCK parameter is set to “Locked” by the software, all user requested writes as determined by the DEFINE_WRITE_LOCK parameter shall be rejected.

The DEFINE_WRITE_LOCK parameter allows the user to configure whether the write lock function will control writing to all blocks, or only to the resource and transducer blocks. Internally updated data such as process variables and diagnostics will not be restricted.
N/A = No blocks are blocked
Physical = Locks resource and transducer block
Everything = Locks every block.

The following table displays all possible configurations of the WRITE_LOCK parameter.

FEATURE_SEL SW_SEL bit	WRITE_LOCK	WRITE_LOCK Read/Write	DEFINE_WRITE_LOCK	Write access to blocks
0 (off)	1 (unlocked)	Read only	NA	All
1 (on)	1 (unlocked)	Read/Write	NA	All
1 (on)	2 (locked)	Read/Write	Physical	Function Blocks only
1 (on)	2 (locked)	Read/Write	Everything	None

FEATURES_SEL
FEATURES_SEL is used to turn on any of the supported features. The default setting of the 644 does not select any of these features. Choose one of the supported features if any.

MAX_NOTIFY

The MAX_NOTIFY parameter value is the maximum number of alert reports that the resource can have sent without getting a confirmation, corresponding to the amount of buffer space available for alert messages. The number can be set lower, to control alert flooding, by adjusting the LIM_NOTIFY parameter value. If LIM_NOTIFY is set to zero, then no alerts are reported.

PlantWeb™ Alerts

The alerts and recommended actions should be used in conjunction with “Operation and Maintenance” on page 4-14.

The Resource Block will act as a coordinator for PlantWeb alerts. There will be three alarm parameters (FAILED_ALARM, MAINT_ALARM, and ADVISE_ALARM) which will contain information regarding some of the device errors which are detected by the transmitter software. There will be a RECOMMENDED_ACTION parameter which will be used to display the recommended action text for the highest priority alarm and a HEALTH_INDEX parameters (0 - 100) indicating the overall health of the transmitter. FAILED_ALARM will have the highest priority followed by MAINT_ALARM and ADVISE_ALARM will be the lowest priority.

FAILED_ALARMS
A failure alarm indicates a failure within a device that will make the device or some part of the device non-operational. This implies that the device is in need of repair and must be fixed immediately. There are five parameters associated with FAILED_ALARMS specifically, they are described below.

FAILED_ENABLED
This parameter contains a list of failures in the device which makes the device non-operational that will cause an alert to be sent. Below is a list of the failures with the highest priority first.

1. Electronics
2. NV Memory
3. HW / SW Incompatible
4. Primary Value
5. Secondary Value

FAILED_MASK
This parameter will mask any of the failed conditions listed in FAILED_ENABLED. A bit on means that the condition is masked out from alarming and will not be reported.

FAILED_PRI
Designates the alerting priority of the FAILED_ALM, see “Alarm Priority” on page 4-12. The default is 0 and the recommended value are between 8 and 15.

FAILED_ACTIVE
This parameter displays which of the alarms is active. Only the alarm with the highest priority will be displayed. This priority is not the same as the FAILED_PRI parameter described above. This priority is hard coded within the device and is not user configurable.

FAILED_ALM
Alarm indicating a failure within a device which makes the device non-operational.

MAINT_ALARMS
A maintenance alarm indicates the device or some part of the device needs maintenance soon. If the condition is ignored, the device will eventually fail. There are five parameters associated with MAINT_ALARMS, they are described below.

MAINT_ENABLED
The MAINT_ENABLED parameter contains a list of conditions indicating the device or some part of the device needs maintenance soon.

Below is a list of the conditions with the highest priority first.

1. Primary Value Degraded
2. Secondary Value Degraded
3. Diagnostic
4. Configuration Error
5. Calibration Error

MAINT_MASK
The MAINT_MASK parameter will mask any of the failed conditions listed in MAINT_ENABLED. A bit on means that the condition is masked out from alarming and will not be reported.

MAINT_PRI
MAINT_PRI designates the alarming priority of the MAINT_ALM, “Process Alarms” on page 4-12. The default is 0 and the recommended values is 3 to 7.

MAINT_ACTIVE
The MAINT_ACTIVE parameter displays which of the alarms is active. Only the condition with the highest priority will be displayed. This priority is not the same as the MAINT_PRI parameter described above. This priority is hard coded within the device and is not user configurable.

MAINT_ALM
An alarm indicating the device needs maintenance soon. If the condition is ignored, the device will eventually fail.

Advisory Alarms
An advisory alarm indicates informative conditions that do not have a direct impact on the device's primary functions There are five parameters associated with ADVISE_ALARMS, they are described below.

ADVISE_ENABLED
The ADVISE_ENABLED parameter contains a list of informative conditions that do not have a direct impact on the device's primary functions. Below is a list of the advisories with the highest priority first.

1. NV Writes Deferred
2. SPM Process Anomaly detected

ADVISE_MASK
The ADVISE_MASK parameter will mask any of the failed conditions listed in ADVISE_ENABLED. A bit on means the condition is masked out from alarming and will not be reported.

ADVISE_PRI
ADVISE_PRI designates the alarming priority of the ADVISE_ALM, see “Process Alarms” on page 4-12. The default is 0 and the recommended values are 1 or 2.

ADVISE_ACTIVE
The ADVISE_ACTIVE parameter displays which of the advisories is active. Only the advisory with the highest priority will be displayed. This priority is not the same as the ADVISE_PRI parameter described above. This priority is hard coded within the device and is not user configurable.

ADVISE_ALM
ADVISE_ALM is an alarm indicating advisory alarms. These conditions do not have a direct impact on the process or device integrity.

Recommended Actions for PlantWeb Alerts

RECOMMENDED_ACTION
The RECOMMENDED_ACTION parameter displays a text string that will give a recommended course of action to take based on which type and which specific event of the PlantWeb alerts are active.

Table 4-1.
RB.RECOMMENDED_ACTION

	Alarm Type	Failed/Maint/Advise Active Event	Recommended Action Text String
PlantWeb Alerts	None	None	No action required
	Advisory	NV Writes Deferred	Non-volatile writes have been deferred, leave the device powered until the advisory goes away
	Maintenance	Configuration Error	Re-write the Sensor Configuration
		Primary Value Degraded	Confirm the operating range of the applied sensor and/or verify the sensor connection and device environment
		Calibration Error	Retrim the device
		Secondary Value Degraded	Verify the ambient temperature is within operating limits
	Failed	Electronics Failure	Replace the Device
		HW / SW Incompatible	Verify the Hardware Revision is compatible with the Software Revision
		NV Memory Failure	Reset the device then download the Device Configuration
		Primary Value Failure	Verify the instrument process is within the Sensor range and / or confirm sensor configuration and wiring.
		Secondary Value Failure	Verify the ambient temperature is within operating limits

Sensor Transducer Block

NOTE
When the engineering units of the XD_SCALE are selected, the engineering units in the Transducer Block change to the same units. THIS IS THE ONLY WAY TO CHANGE THE ENGINEERING UNITS IN THE SENSOR TRANSDUCER BLOCK.

Damping

⚠ The damping parameter in the Transducer Block may be used to filter measurement noise. By increasing the damping time, the transmitter will have a slower response time, but will decrease the amount of process noise that is translated to the Transducer Block Primary Value. Because both the LCD and AI Block get input from the Transducer Block, adjusting the damping parameter will effect both blocks.

NOTE
The AI Block has it's own filtering parameter called PV_FTIME. For simplicity, it is better to do filtering in the Transducer Block as damping will be applied to primary value on every sensor update. If filtering is done in AI block, damping will be applied to output every macrocycle. The LCD will display value from Transducer block.

Analog Input (AI) Function Block

Configure the AI block

⚠ A minimum of four parameters are required to configure the AI Block. The parameters are described below with example configurations shown at the end of this section.

CHANNEL
Select the channel that corresponds to the desired sensor measurement. The 644 measures both sensor temperature (channel 1) and terminal temperature (channel 2).

L_TYPE
The L_TYPE parameter defines the relationship of the sensor measurement (sensor temperature) to the desired output temperature of the AI Block. The relationship can be direct or indirect.

Direct
Select direct when the desired output will be the same as the sensor measurement (sensor temperature).

Indirect
Select indirect when the desired output is a calculated measurement based on the sensor measurement (e.g. ohm or mV). The relationship between the sensor measurement and the calculated measurement will be linear.

XD_SCALE and OUT_SCALE
The XD_SCALE and OUT_SCALE each include four parameters: 0%, 100%, engineering units, and precision (decimal point). Set these based on the L_TYPE:

L_TYPE is Direct
When the desired output is the measured variable, set the XD_SCALE to represent the operating range of the process. Set OUT_SCALE to match XD_SCALE.

L_TYPE is Indirect
When an inferred measurement is made based on the sensor measurement, set the XD_SCALE to represent the operating range that the sensor will see in the process. Determine the inferred measurement values that correspond to the XD_SCALE 0 and 100% points and set these for the OUT_SCALE.

NOTE
To avoid configuration errors, only select Engineering Units for XD_SCALE and OUT_SCALE that are supported by the device. The supported units are:

Pressure (Channel 1)	Temperature (Channel 2)
°C	°C
°F	°F
K	K
R	R
Ω	Ω
mV	mV

When the engineering units of the XD_SCALE are selected, this causes the engineering units of the PRIMARY_VALUE_RANGE in the Transducer Block to change to the same units. THIS IS THE ONLY WAY TO CHANGE THE ENGINEERING UNITS IN THE SENSOR TRANSDUCER BLOCK, PRIMARY_VALUE_RANGE parameter.

Configuration Examples

4-wire, Pt 100 α = 385
AI1 = Process Temperature
AI2 = Terminal Temperature

Transducer Block
If Host System Supports Methods:
1. Click on Methods
2. Choose Sensor Connections
3. Follow on-screen instruction.

If Host System Doesn't Not Support Methods:
1. Put transducer block into OOS mode.
   a. Go to MODE_BLK.TARGET
   b. Choose OOS (0x80)
2. Go to SENSOR_CONNECTION.
   a. Choose 4-wire (0x4)
3. Go to SENSOR_TYPE.
   a. Choose PT100A385
4. Put the transducer block back into Auto mode.

AI Blocks (Basic Configuration)[1]

AI1 as Process Temperature

1. Put the AI Block into OOS mode.
   a. Go to MODE_BLK.TARGET
   b. Choose OOS (0x80)
2. Go to CHANNEL
   a. Choose Sensor 1
3. Go to L_TYPE
   a. Choose Direct
4. Go to XD_Scale
   a. Choose UNITS_INDEX to be °C
5. Go to OUT_SCALE
   a. Choose UNITS_INDEX to be °C
   b. Set the 0 and 100 scale to be the same as the PRIMARY_VALUE_RANGE
6. Put the AI Block back into Auto mode.
7. Follow Host Procedure Download Schedule into Block.

AI2 as Terminal Temperature

1. Put the AI Block into OOS mode.
   a. Go to MODE_BLK.TARGET
   b. Choose OOS (0x80)
2. Go to CHANNEL
   a. Choose Body Temperature
3. Go to L_TYPE
   a. Choose Direct
4. Go to XD_Scale
   a. Choose UNITS_INDEX to be °C
5. Go to OUT_SCALE
   a. Choose UNITS_INDEX to be °C
   b. Set the 0 and 100 scale to be the same as the SECONDARY_VALUE_RANGE
6. Put the AI Block back into Auto mode.
7. Follow Host Procedure Download Schedule into Block.

(1) Configure a minimum of four parameters to get a value out of the AI Block

Filtering

⚠ The filtering feature changes the response time of the device to smooth variations in output readings caused by rapid changes in input. Adjust the filter time constant (in seconds) using the PV_FTIME parameter. Set the filter time constant to zero to disable the filter feature.

Process Alarms

Process Alarm detection is based on the OUT value. Configure the alarm limits of the following standard alarms:

- High (HI_LIM)
- High high (HI_HI_LIM)
- Low (LO_LIM)
- Low low (LO_LO_LIM)

In order to avoid alarm chattering when the variable is oscillating around the alarm limit, an alarm hysteresis in percent of the PV span can be set using the ALARM_HYS parameter. The priority of each alarm is set in the following parameters:

- HI_PRI
- HI_HI_PRI
- LO_PRI
- LO_LO_PRI

Alarm Priority

Alarms are grouped into five levels of priority:

Priority Number	Priority Description
0	The alarm condition is not used.
1	An alarm condition with a priority of 1 is recognized by the system, but is not reported to the operator.
2	An alarm condition with a priority of 2 is reported to the operator.
3-7	Alarm conditions of priority 3 to 7 are advisory alarms of increasing priority.
8-15	Alarm conditions of priority 8 to 15 are critical alarms of increasing priority.

Status Options

Status Options (STATUS_OPTS) supported by the AI block are shown below:

Propagate Fault Forward
If the status from the sensor is Bad, Device failure or Bad, Sensor failure, propagate it to OUT without generating an alarm. The use of these sub-status in OUT is determined by this option. Through this option, the user may determine whether alarming (sending of an alert) will be done by the block or propagated downstream for alarming.

Uncertain if Limited
Set the output status of the Analog Input block to uncertain if the measured or calculated value is limited.

BAD if Limited
Set the output status to Bad if the sensor is violating a high or low limit.

Uncertain if Man Mode
Set the output status of the Analog Input block to uncertain if the actual mode of the block is Man.

NOTE
The instrument must be in Out of Service mode to set the status option.

Advanced Features

The AI Function Block provides added capability through the addition of the following parameters:

ALARM_TYPE
ALARM_TYPE allows one or more of the process alarm conditions detected by the AI function block to be used in setting its OUT_D parameter.

OUT_D
OUT_D is the discrete output of the AI function block based on the detection of process alarm condition(s). This parameter may be linked to other function blocks that require a discrete input based on the detected alarm condition.

LCD Transducer Block

The LCD meter connects directly to the 644 electronics FOUNDATION fieldbus output board. The meter indicates output and abbreviated diagnostic messages.

The first line of five characters displays the sensor being measured.

If the measurement is in error, “Error” appears on the first line. The second line indicates if the device or the sensor is causing the error.

Each parameter configured for display will appear on the LCD for a brief period before the next parameter is displayed. If the status of the parameter goes bad, the LCD will also cycle diagnostics following the displayed variable:

Custom Meter Configuration

Shipped from the factory, Parameter #1 is configured to display the Primary Variable (temperature) from the LCD Transducer Block. Parameters 2 – 4 are not configured. To change the configuration of Parameter #1 or to configure additional parameters 2 – 4, use the configuration parameters below.

The LCD Transducer Block can be configured to sequence four different process variables as long as the parameters are sourced from a function block that is scheduled to execute within the 644 temperature transmitter. If a function block is scheduled in the 644 that links a process variable from another device on the segment, that process variable can be displayed on the LCD.

DISPLAY_PARAM_SEL
The DISPLAY_PARAM_SEL parameter specifies how many process variables will be displayed. Select up to four display parameters.

BLK_TAG_#(1)
Enter the Block Tag of the function block that contains the parameter to be displayed. The default function block tags from the factory are:

TRANSDUCER
AI 1300
AI 1400
PID 1500

BLK_TYPE_#(1)
Enter the Block Type of the function block that contains the parameter to be displayed. This parameter is generally selected via a drop-down menu with a list of possible function block types. (e.g. Transducer, PID, AI, etc.)

PARAM_INDEX_#(1)
The PARAM_INDEX_# parameter is generally selected via a drop-down menu with a list of possible parameter names based upon what is available in the function block type selected. Choose the parameter to be displayed.

CUSTOM_TAG_#(1)
The CUSTOM_TAG_# is an optional user-specified tag identifier that can be configured to be displayed with the parameter in place of the block tag. Enter a tag of up to five characters.

UNITS_TYPE_#(1)
The UNITS_TYPE_# parameter is generally selected via a drop-down menu with three options: AUTO, CUSTOM, or NONE. Select AUTO only when the parameter to be displayed is pressure, temperature, or percent. For other parameters, select CUSTOM and be sure to configure the CUSTOM_UNITS_# parameter. Select NONE if the parameter is to be displayed without associated units.

CUSTOM_UNITS_#(1)
Specify custom units to be displayed with the parameter. Enter up to six characters. To display Custom Units the UNITS_TYPE_# must be set to CUSTOM.

OPERATION AND MAINTENANCE

Overview

This section contains information on operation and maintenance procedures.

METHODS AND MANUAL OPERATION
Each FOUNDATION fieldbus host or configuration tool has different ways of displaying and performing operations. Some hosts will use Device Descriptions (DD) and DD Methods to complete device configuration and will display data consistently across platforms. The DD can found on www.rosemount.com. There is no requirement that a host or configuration tool support these features.

The information in this section will describe how to use methods in a general fashion. In addition, if your host or configuration tool does not support methods this section will cover manually configuring the parameters involved with each method operation. For more detailed information on the use of methods, see your host or configuration tool manual.

(1) # represents the specified parameter number.

Troubleshooting Guides

Figure 4-1. 644 troubleshooting flowchart

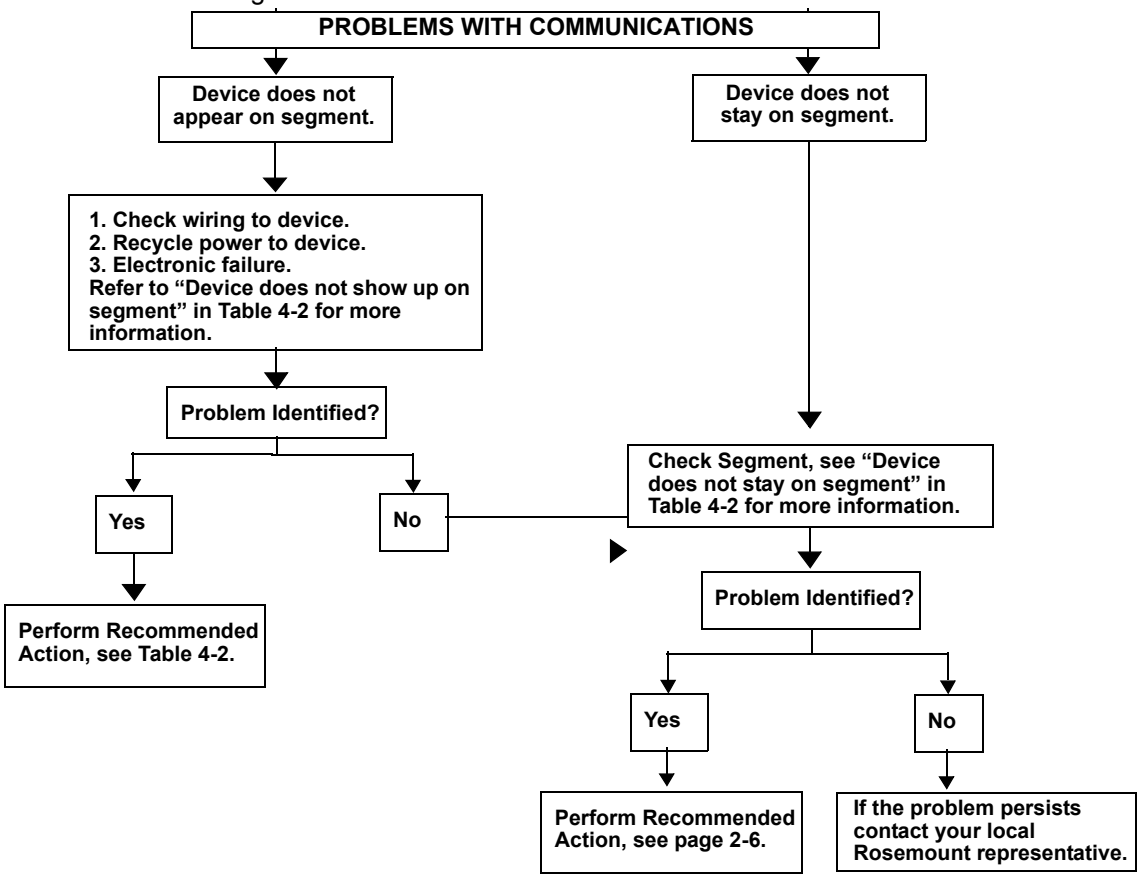


Table 4-2. Troubleshooting guide.

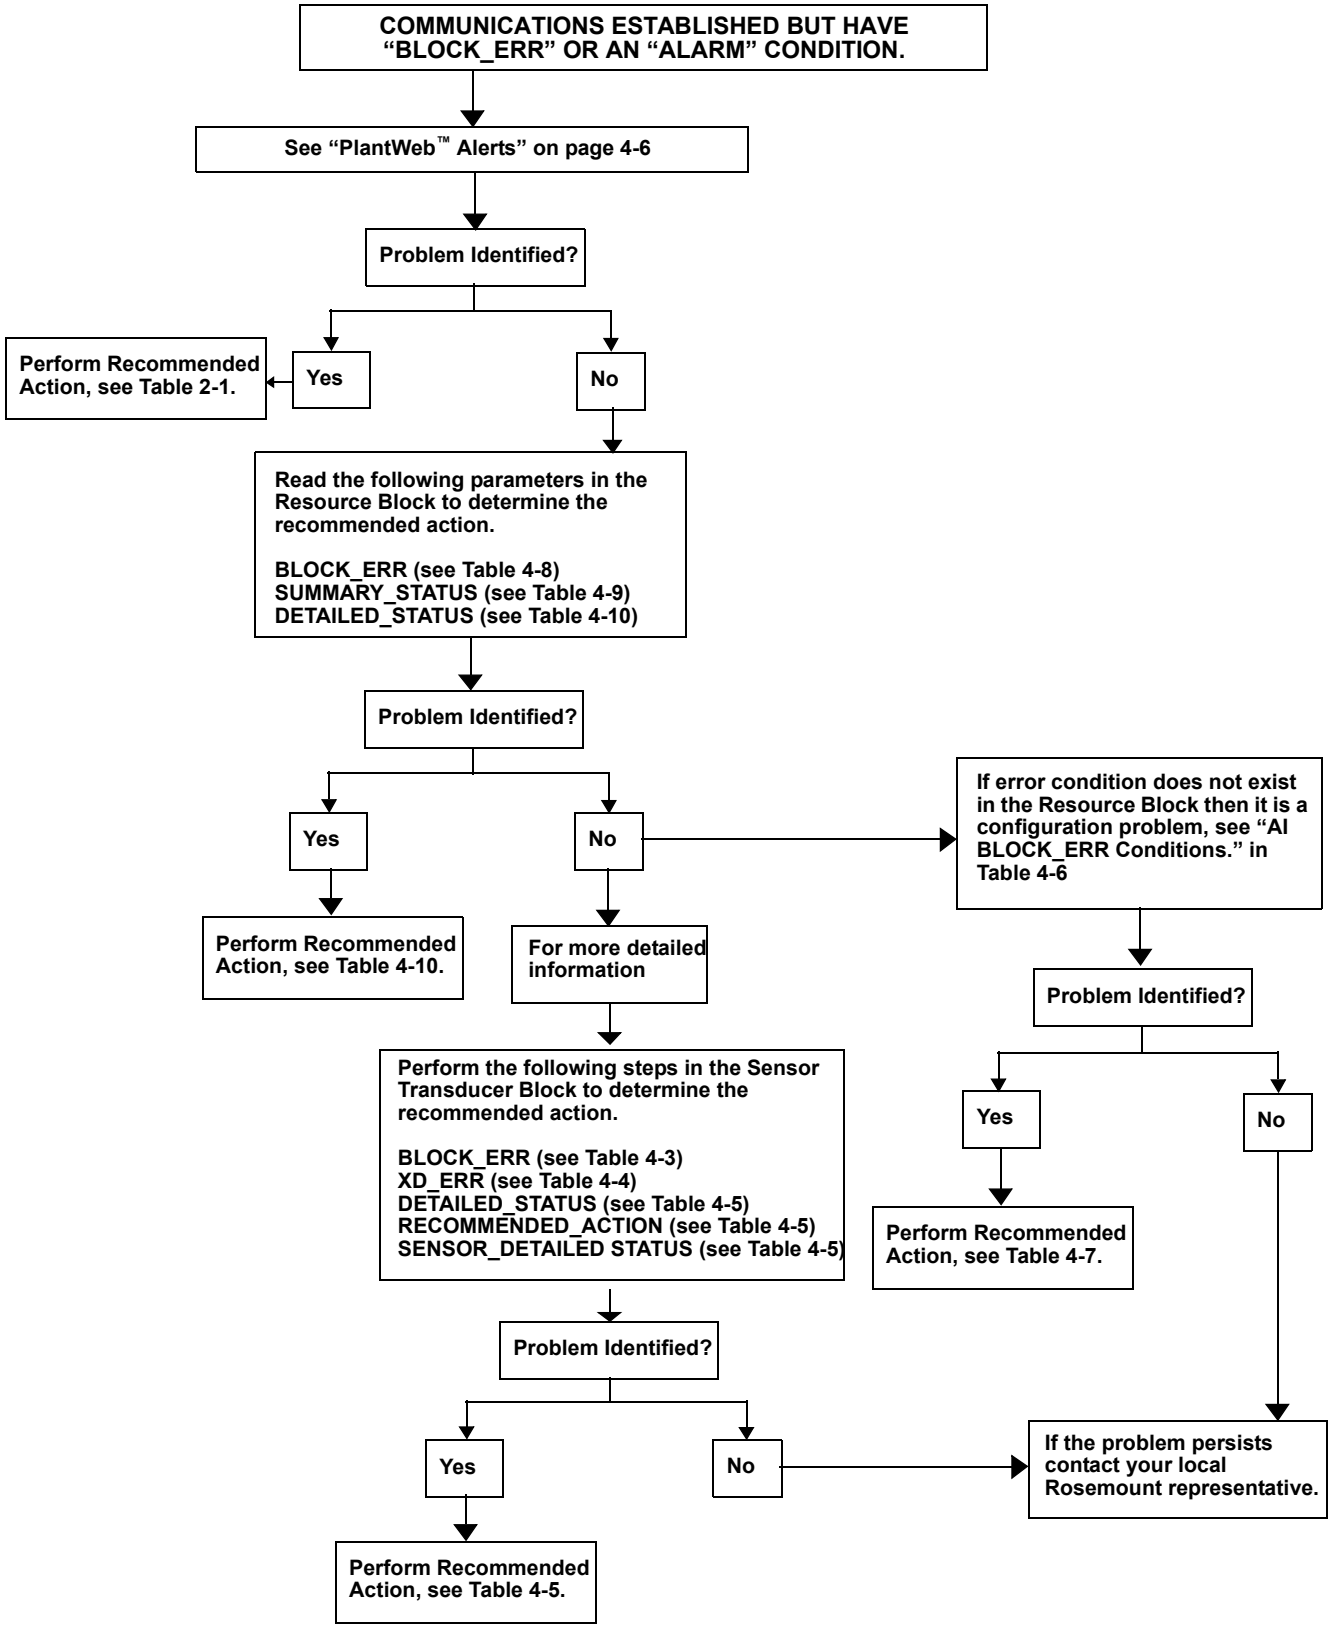
Symptom[1]	Cause	Recommended Actions
Device does not show up on segment	Unknown	Recycle power to device
	No power to device	1. Ensure the device is connected to the segment. 2. Check voltage at terminals. There should be 9–32Vdc. 3. Check to ensure the device is drawing current. There should be approximately 10.5 mA nominal (11 mA max.)
	Segment problems	
	Electronics failing	1. Replace device.
	Incompatible network settings	Change host network parameters. Refer to host documentation for procedure.
Device does not stay on segment[2]	Incorrect signal levels. Refer to host documentation for procedure.	1. Check for two terminators. 2. Excess cable length. 3. Bad Power supply or conditioner
	Excess noise on segment. Refer to host documentation for procedure.	1. Check for incorrect grounding. 2. Check for correct shielded wire. 3. Tighten wire connections. 4. Check for corrosion or moisture on terminals. 5. Check for Bad power supply.
	Electronics failing	1. Replace device.
	Other	1. Check for water around the transmitter.

(1) The corrective actions should be done with consultation of your system integrator.
(2) Wiring and installation 31.25 kbit/s, voltage mode, wire medium application guide AG-140 available from the fieldbus Foundation.

Figure 4-2. Problems with communications flowchart



Sensor Transducer Block

Sensor Calibration, Lower and Upper Trim Methods

⚠ In order to calibrate the transmitter, run the Lower and Upper Trim Methods. If your system does not support methods, manually configure the Transducer Block parameters listed below.

1. Set MODE_BLK.TARGET to OOS
2. Set SENSOR_CAL_METHOD to User Trim
3. Set CAL_UNIT to supported engineering units in the Transducer Block
4. Apply temperature that corresponds to the lower calibration point and allow the temperature to stabilize. The temperature must be between the range limits defined in PRIMRY_VALUE_RANGE.
5. Set values of CAL_POINT_LO to correspond to the temperature applied by the sensor.
6. Apply temperature, temperature corresponding to the upper calibration
7. Allow temperature to stabilize.
8. Set CAL_POINT_HI

NOTE
CAL_POINT_HI must be within PRIMARY_VALUE_RANGE and greater than CAL_POINT_LO + CAL_MIN_SPAN

9. Set SENSOR_CAL_DATE to the current date.
10. Set SENSOR_CAL_WHO to the person responsible for the calibration.
11. Set SENSOR _CAL_LOC to the calibration location.
12.
13. Set MODE_BLK.TARGET to AUTO

NOTE
If trim fails the transmitter will automatically revert to factory trim.

Excessive correction or sensor failure could cause device status to read “calibration error.” To clear this, trim the transmitter

Recall Factory Trim

⚠ To recall a factory trim on the transmitter, run the Recall Factory Trim. If your system does not support methods, manually configure the Transducer Block parameters listed below.

1. Set MODE_BLK.TARGET to OOS
2. Set SENSOR_CAL_METHOD to Factory Trim.
3. Set SET_FACTORY_TRIM to Recall.
4. Set SENSOR_CAL_DATE to the current date.
5. Set SENSOR_CAL_WHO to the person responsible for the calibration.
6. Set SENSOR _CAL_LOC to the calibration location.
7. Set MODE_BLK.TARGET to AUTO.

NOTE
When sensor type is changed, the transmitter reverts to the factory trim. Changing sensor type causes you to loose any trim performed on the transmitter.

Table 4-3. Sensor Transducer Block BLOCK_ERR messages

Condition Name and Description
Other
Out of Service: The actual mode is out of service.

Table 4-4. Sensor Transducer Block XD_ERR messages

Condition Name and Description
Electronics Failure: An electrical component failed.
I/O Failure: An I/O failure occurred.
Software Error: The software has detected an internal error.
Calibration Error: An error occurred during calibration of the device.
Algorithm Error: The algorithm used in the transducer block produced an error due to overflow, data reasonableness failure, etc.

Diagnostics

Table 4-5 lists the potential errors and the possible corrective actions for the given values. The corrective actions are in order of increasing system level compromises. The first step should always be to reset the transmitter and then if the error persists, try the steps in Table 4-5. Start with the first corrective action and then try the second.

Table 4-5. Sensor Transducer Block STB.SENSOR_ DETAILED_ STATUS messages

STB.SENSOR_DETAILED_STATUS	Description
Invalid Configuration	Wrong sensor connection with wrong sensor type
ASIC RCV Error	The micro detected a chksum or start/stop bit failure with ASIC communication
ASIC TX Error	The A/D ASIC detected a communication error
ASIC Interrupt Error	ASIC interrupts are too fast or slow
Reference Error	Reference resistors are greater than 25% of known value
ASIC Configuration Error	Citadel registers were not written correctly. (Also CALIBRATION_ERR)
Sensor Open	Open sensor detected
Sensor Shorted	Shorted sensor detected
Terminal Temperature Failure	Open PRT detected
Sensor Out of Operating Range	Sensor readings have gone beyond PRIMRY_VALUE_RANGE values
Sensor beyond operating limits	Sensor readings have gone below 2% of lower range or above 6% of upper range of sensor.
Terminal Temperature Out of Operating Range	PRT readings have gone beyond SECONDARY_VALUE_RANGE values
Terminal Temperature Beyond Operating Limits	PRT readings have gone below 2% of lower range or above 6% of upper range of PRT. (These ranges are calculated and are not the actual range of the PRT which is a PT100 A385)
Sensor Degraded	For RTDs, this is excessive EMF detected. This is thermocouple degradation for thermocouples.
Sensor Error	The user trim has failed due to excessive correction or sensor failure during the trim method

Analog Input (AI) Function Block

Status

Along with the measured or calculated PV value, every FOUNDATION Fieldbus block passes an additional parameter called STATUS. The PV and STATUS are passed from the Transducer Block to the Analog Input Block. The STATUS can be one of the following: GOOD, BAD, or UNCERTAIN. When there are no problems detected by the self-diagnostics of the block, the STATUS will be GOOD. If a problem occurs with the hardware in the device, or, the quality of the process variable is compromised for some reason, the STATUS will become either BAD or UNCERTAIN depending upon the nature of the problem. It is important that the Control Strategy that makes use of the Analog Input Block is configured to monitor the STATUS and take action where appropriate when the STATUS is no longer GOOD.

Simulation

⚠ Simulate replaces the channel value coming from the Sensor Transducer Block. For testing purposes, it is possible to manually drive the output of the Analog Input Block to a desired value. There are two ways to do this.

Manual Mode
To change only the OUT_VALUE and not the OUT_STATUS of the AI Block, place the TARGET MODE of the block to MANUAL. Then, change the OUT_VALUE to the desired value.

Simulate

1. If the SIMULATE switch is in the OFF position, move it to the ON position. If the SIMULATE jumper is already in the ON position, you must move it to off and place it back in the ON position.

NOTE
As a safety measure, the switch must be reset every time power is interrupted to the device in order to enable SIMULATE. This prevents a device that is tested on the bench from getting installed in the process with SIMULATE still active.

2. To change both the OUT_VALUE and OUT_STATUS of the AI Block, set the TARGET MODE to AUTO.
3. Set SIMULATE_ENABLE_DISABLE to ‘Active’.
4. Enter the desired SIMULATE_VALUE to change the OUT_VALUE and SIMULATE_STATUS_QUALITY to change the OUT_STATUS. If errors occur when performing the above steps, be sure that the SIMULATE jumper has been reset after powering up the device.

Table 4-6. AI BLOCK_ERR Conditions.

Condition Number	Condition Name and Description
0	Other
1	**Block Configuration Error:** the selected channel carries a measurement that is incompatible with the engineering units selected in XD_SCALE, the L_TYPE parameter is not configured, or CHANNEL = zero.
3	**Simulate Active:** Simulation is enabled and the block is using a simulated value in its execution.
7	**Input Failure/Process Variable has Bad Status:** The hardware is bad, or a bad status is being simulated.
14	**Power Up**
15	**Out of Service:** The actual mode is out of service.

Table 4-7. Troubleshooting the AI block

Symptom	Possible Causes	Recommended Actions
Bad or no temperature readings (Read the AI “BLOCK_ERR” parameter)	BLOCK_ERR reads OUT OF SERVICE (OOS)	1. AI Block target mode target mode set to OOS. 2. Resource Block OUT OF SERVICE.
	BLOCK_ERR reads CONFIGURATION ERROR	1. Check CHANNEL parameter (see “CHANNEL” on page 2-9) 2. Check L_TYPE parameter (see “L_TYPE” on page 2-9) 3. Check XD_SCALE engineering units. (see “XD_SCALE and OUT_SCALE” on page 2-10
	BLOCK_ERR reads POWERUP	Download Schedule into block. Refer to host for downloading procedure.
	BLOCK_ERR reads BAD INPUT	1. Sensor Transducer Block Out Of Service (OOS) 2. Resource Block Out of Service (OOS)
	No BLOCK_ERR but readings are not correct. If using Indirect mode, scaling could be wrong.	1. Check XD_SCALE parameter. 2. Check OUT_SCALE parameter. (see “XD_SCALE and OUT_SCALE” on page 2-10)
	No BLOCK_ERR. Sensor needs to be calibrated or Zero trimmed.	See Section 3: Operation and Maintenance to determine the appropriate trimming or calibration procedure.
OUT parameter status reads UNCERTAIN and substatus reads EngUnitRangViolation.	Out_ScaleEU_0 and EU_100 settings are incorrect.	See “XD_SCALE and OUT_SCALE” on page 2-10.

Resource Block

This section describes error conditions found in the Resource block. Read Table 4-8 through Table 4-10 to determine the appropriate corrective action.

Block Errors

Table 4-8. Resource Block BLOCK_ERR messages

Table 4-8 lists conditions reported in the BLOCK_ERR parameter.

Condition Name and Description
Other
Device Needs Maintenance Now
Memory Failure: A memory failure has occurred in FLASH, RAM, or EEPROM memory
Lost NV Data: Non-volatile data that is stored in non-volatile memory has been lost.
Device Needs Maintenance Now
Out of Service: The actual mode is out of service.

Table 4-9. Resource Block SUMMARY_STATUS messages

Condition Name
No repair needed
Repairable
Call Service Center

Table 4-10. Resource Block RB.DETAILED_STATUS

RB.DETAILED_STATUS	Description
Sensor Transducer block error.	Active when any SENSOR_DETAILED_STAUS bit is on
Manufacturing Block integrity error	The manufacturing block size, revision, or checksum is wrong
Hardware/software incompatible	Verify the manufacturing block revision and the hardware revision are correct/compatible with the software revision.
Non-volatile memory integrity error	Invalid checksum on a block of NV data
ROM integrity error	Invalid application code checksum
Lost deferred NV data	Device has been power-cycled while non-volatile writes were being deferred to prevent premature memory failure, the write operations have been deferred.
NV Writes Deferred	A high number of writes has been detected to non-volatile memory. To prevent premature failure, the write operations have been deferred.

LCD Transducer block

This section describes error conditions found in the LCD Transducer Block. Read Table 4-11 and to determine the appropriate corrective action.

Self Test Procedure for the LCD

The SELF_TEST parameter in the Resource block will test LCD segments. When running, the segments of the display should light up for about five seconds.

If your host system supports methods refer to your host documentation on how to run the “Self Test” method. If your host system does not support methods than you can run this test manually be following the steps below.

1. Put Resource block into “OOS” (Out of Service).
2. Go to the parameter called “SELF_TEST” and write the value Self test (0x2).
3. Observe the LCD screen when you are doing this. All of the segments should light up.
4. Put the Resource block back into “AUTO”.

Table 4-11. LCD Transducer Block BLOCK_ERR messages

Condition Name and Description
Other
Out of Service: The actual mode is out of service.

Symptom	Possible Causes	Recommended Action
The LCD displays “DSPLY#INVLID.” Read the BLOCK_ERR and if it says “BLOCK CONFIGURATION” perform the Recommended Action	One or more of the display parameters are not configured properly.	See “LCD Transducer Block” on page 2-16.
The Bar Graph and the AI.OUT readings do not match.	The OUT_SCALE of the AI block is not configured properly.	See “Analog Input (AI) Function Block” on page 2-9 and “Display bar graph” on page 2-18.
“644” is being displayed or not all of the values are being displayed.	The LCD block parameter “DISPLAY_PARAMETER_SELECT is not properly configured.	See “LCD Transducer Block” on page 2-16.
The display reads OOS	The resource and or the LCD Transducer block are OOS.	Verify that both blocks are in “AUTO,”
The display is hard to read.	Some of the LCD segments may have gone bad.	See XXXX (Self Test). If some of the segment is bad, replace the LCD.
	Device is out o the temperature limit for the LCD. (-20 to 80 °C)	Check ambient temperature of the device.

HART AND FOUNDATION FIELDBUS SPECIFICATIONS

Functional

Inputs
User-selectable; sensor terminals rated to 42.4 V dc. See “Accuracy” on page A-8 for sensor options.

Output
Single 2-wired device with either 4–20 mA/HART, linear with temperature or input; or a completely digital output with FOUNDATION fieldbus communication (ITK 4.5 compliant).

Isolation
Input/output isolation tested to 500 V DC/AC rms (707 V DA) at 50/60 Hz

Local Display
The optional five-digit integral LCD Display includes a floating or fixed decimal point. It can also display engineering units (°F, °C, °R, K, Ω, and millivolts), milliampere, and percent of span. The display can be configured to alternate between selected display options. Display settings are preconfigured at the factory according to the standard transmitter configuration. They can be reconfigured in the field using either HART or FOUNDATION fieldbus communications.

Humidity Limits
0–99% relative humidity

Update Time
≤ 0.5 seconds

Physical

Electrical Connections

Model	Power and Sensor Terminals
644H	Compression screws permanently fixed to terminal block
644R	Compression screw permanently fixed to front panel

WAGO® Spring clamp terminals are optional (option code G5)

HART Communicator Connections

Communication Terminals	
644H	Clips permanently fixed to terminal block
644R	Clips permanently fixed to front panel

Materials of Construction

Electronics Housing and Terminal Block	
644H	*Noryl*® glass reinforced
644R	*Lexan*® polycarbonate
Enclosure (Option code J5 or J6)	
Housing	Low-copper aluminum
Paint	Polyurethane
Cover O-ring	Buna-N

Mounting

The 644R attaches directly to a wall or a DIN rail. The 644H installs in a connection head or universal head mounted directly on a sensor assembly, apart from a sensor assembly using a universal head, or to a DIN rail using an optional mounting clip.

Weight

Code	Options	Weight
644H	HART, Head Mount Transmitter	96 g (3.39 oz)
644H	FOUNDATION fieldbus, Head Mount Transmitter	92 g (3.25 oz)
644R	HART, Rail Mount Transmitter	174 g (6.14 oz)
M5	LCD Display	38 g (1.34 oz)
J5, J6	Universal Head, Standard Cover	577 g (20.35 oz)
J5, J6	Universal Head, Meter Cover	667 g (23.53 oz)

Enclosure Ratings (644H)

All option codes (S1, S2, S3, S4, J5 and J6) are NEMA 4X, IP66, and IP68. Option code J6 is CSA Enclosure Type 4X.

Performance

EMC (ElectroMagnetic Compatibility) NAMUR NE 21 Standard

The 644H HART meets the requirements for NAMUR NE 21 Rating. (Hardware Rev 26 and later for HART devices.)

Susceptibility	Parameter	Influence
ESD	• 6 kV contact discharge • 8 kV air discharge	HART None
Radiated	• 80 – 1000 MHz at 10 V/m AM	< 0.5%
Burst	• 1 kV for I.O.	None
Surge	• 0.5 kV line–line • 1 kV line–ground (I.O. tool)	None
Conducted	• 150 kHz to 80 MHz at 10 V	< 0.5%

CE Mark

The 644 meets all requirements listed under IEC 61326: Amendment 1, 1998.

Power Supply Effect

Less than ±0.005% of span per volt

Stability

RTDs and thermocouples have a stability of ±0.15% of output reading or 0.15 °C (whichever is greater) for 24 months

Self Calibration

The analog-to-digital measurement circuitry automatically self-calibrates for each temperature update by comparing the dynamic measurement to extremely stable and accurate internal reference elements.

Vibration Effect

The 644 is tested to the following specifications with no effect on performance:

Frequency	Vibration
10 to 60 Hz	0.21 mm displacement
60 to 500 Hz	3 g peak acceleration

Sensor Connections

2-wire RTD and Ω | **3-wire RTD and Ω*** | **4-wire RTD and Ω** | **T/C and mV**

644-000B01A

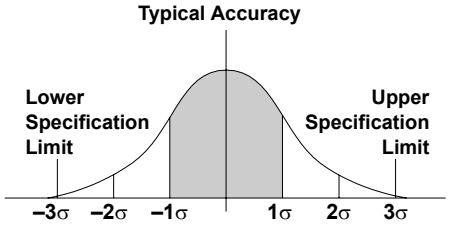
* *Rosemount Inc. provides 4-wire sensors for all single element RTDs. You can use these RTDs in 3-wire configurations by leaving the unneeded leads disconnected and insulated with electrical tape.*

Rosemount Conformance to Specifications

A Rosemount product not only meets its published specifications, but most likely exceeds them. Advanced manufacturing techniques and the use of Statistical Process Control provide specification conformance to at least ± 3σ[(1)]. Our commitment to continual improvement ensures that product design, reliability, and performance will improve annually.

For example, the Reference Accuracy distribution for the 644 is shown to the right. Our Specification Limits are ± 0.15 °C, but, as the shaded area shows, approximately 68% of the units perform three times better than the limits. Therefore, it is very likely that you will receive a device that performs much better than our published specifications.

Conversely, a vendor who "grades" product without using Process Control, or who is not committed to ± 3σ performance, will ship a higher percentage of units that are barely within advertised specification limits.



Accuracy distribution shown is for the 644, Pt 100 RTD sensor, Range 0 to 100 °C

(1) Sigma (σ) is a statistical symbol to designate the standard deviation from the mean value of a normal distribution.

FOUNDATION FIELDBUS SPECIFICATIONS

Function Blocks

Resource Block

- The resource block contains physical transmitter information including available memory, manufacture identification, device type, software tag, and unique identification.

Transducer Block

- The transducer block contains the actual temperature measurement data, including sensor 1 and terminal temperature. It includes information about sensor type and configuration, engineering units, linearization, reranging, damping, temperature correction, and diagnostics.

LCD Block

- The LCD block is used to configure the local display, if a LCD Display is being used.

Analog Input (AI)

- Processes the measurement and makes it available on the fieldbus segment
- Allows filtering, alarming, and engineering unit changes.

PID Block

- The transmitter provides control functionality with one PID function block in the transmitter. The PID block can be used to perform single loop, cascade, or feedforward control in the field.

Instantiable Function Blocks

- All the function blocks used by the transmitter are instantiable, meaning the total number of function blocks is only limited by the physical memory available in the transmitter. Since only the instantiable blocks can use physical memory, any combination of function blocks can be used at any given time as long as the physical memory size is not violated.

Block	Execution Time (milliseconds)
Resource	–
Transducer	–
LCD Block	–
Analog Input 1	45
Analog Input 2	45
PID 1	60

Turn-on Time

Performance within specifications in less than 20 seconds after power is applied, when damping value is set to 0 seconds.

Status

If self-diagnostics detect a sensor burnout or a transmitter failure, the status of the measurement will be updated accordingly. Status may also send the PID output to a safe value.

Power Supply

Powered over FOUNDATION Fieldbus with standard fieldbus power supplies. The transmitter operates between 9.0 and 32.0 VDC, 11 mA maximum. The power terminals are rated to 42.4 VDC max.

Alarms

The AI function block allows the user to configure the alarms to HI-HI, HI, LO, or LO-LO with a variety of priority levels and hysteresis settings.

Backup Link Active Scheduler (LAS)

The transmitter is classified as a device link master, which means it can function as a Link Active Scheduler (LAS) if the current link master device fails or is removed from the segment.

The host or other configuration tool is used to download the schedule for the application to the link master device. In the absence of a primary link master, the transmitter will claim the LAS and provide permanent control for the H1 segment.

FOUNDATION Fieldbus Parameters

Schedule Entries	25(1)
Links	16(1)
Virtual Communications Relationships (VCR)	12(1)

(1) Minimum quantity.

Software Upgrade in the Field

Software for the 644 with FOUNDATION fieldbus will be easy to upgrade in the field. Users will be able to take advantage of software enhancements by loading new application software into the device memory.

4–20 mA / HART SPECIFICATIONS

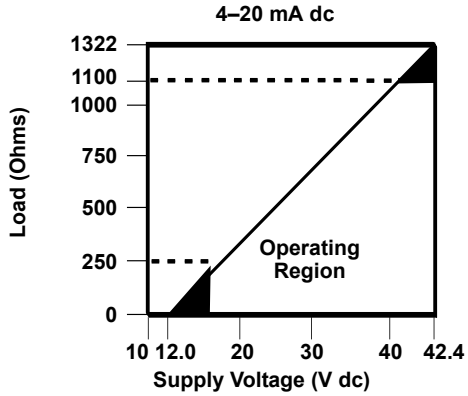
Communication Requirements

Transmitter power terminals are rated to 42.4 V DC. A HART Communicator requires a loop resistance between 250 – 1100 ohms. The 644 HART device does not communicate when power is below 12 V DC at the transmitter terminals.

Power Supply

An external power supply is required for HART devices. The transmitter operates on 12.0 to 42.4 VDC transmitter terminal voltage with load resistance between 250 and 660 ohms. A minimum of 17.75 VDC power supply is required with a load of 250 ohms. Transmitter power terminals are rated to 42.4 V DC.

Maximum Load = 40.8 x (Supply Voltage – 12.0)



Temperature Limits

	Operating Limit	Storage Limit
With LCD Display	–4 to 185 °F –20 to 85 °C	–50 to 185 °F –45 to 85 °C
Without LCD Display	–40 to 185 °F –40 to 85 °C	–58 to 248 °F –50 to 120 °C

Hardware and Software Failure Mode

The 644 features software driven alarm diagnostics. The independent circuit is designed to provide backup alarm output if the microprocessor software fails. The alarm directions (HIGH/LO) are user-selectable using the failure mode switch. If failure occurs, the position of the switch determines the direction in which the output is driven (HI or LO). The switch feeds into the digital-to-analog (D/A) converter, which drives the proper alarm output even if the microprocessor fails. The values at which the transmitter drives its output in failure mode depends on whether it is configured to standard, custom, or NAMUR-compliant (NAMUR recommendation NE 43, June 1997) operation. Table 1 shows the alarm ranges available for the device to be configured to.

TABLE 1. Available Alarm Range(1)

	Standard	NAMUR- NE 43 Compliant
Linear Output:	$3.9 \leq I^{(2)} \leq 20.5$	$3.8 \leq I \leq 20.5$
Fail High:	$21 \leq I \leq 23$	$21 \leq I \leq 23$
Fail Low:	$3.5 \leq I \leq 3.75$	$3.5 \leq I \leq 3.6$

(1) Measured in milliamperes.
(2) I = Process Variable (current output).

Custom Alarm and Saturation Level

Custom factory configuration of alarm and saturation level is available with option code C1 for valid values. These values can also be configured in the field using a HART Communicator.

Turn-on Time

Performance within specifications in less than 5.0 seconds after power is applied, when damping value is set to 0 seconds.

Transient Protection

The Rosemount 470 prevents damage from transients induced by lightning, welding, or heavy electrical equipment. For more information, refer to the 470 Product Data Sheet (document number 00813-0100-4191).

Accuracy

TABLE 2. Rosemount 644 Input Options and Accuracy.

Sensor Options	Sensor Reference	Input Ranges		Recommended Min. Span[1]		Digital Accuracy[2]		D/A Accuracy[3]
2-, 3-, 4-wire RTDs		°C	°F	°C	°F	°C	°F	
Pt 100	IEC 751, 1995 (α = 0.00385)	–200 to 850	–328 to 1562	10	18	± 0.15	± 0.27	±0.03% of span

DIN Type U	DIN 43710	–200 to 600	–328 to 1112	25	45	± 0.35	± 0.63	±0.03% of span
Type W5Re/W26Re	ASTM E 988-96	0 to 2000	32 to 3632	25	45	± 0.70	± 1.26	±0.03% of span
Millivolt Input		–10 to 100 mV		3 mV		±0.015 mV		±0.03% of span
2-, 3-, 4-wire Ohm Input		0 to 2000 ohms		20 ohm		±0.45 ohm		±0.03% of span

(1) No minimum or maximum span restrictions within the input ranges. Recommended minimum span will hold noise within accuracy specification with damping at zero seconds.
(2) The published digital accuracy applies over the entire sensor input range. Digital output can be accessed by HART or FOUNDATION fieldbus Communications or Rosemount control system.
(3) Total Analog accuracy is the sum of digital and D/A accuracies.
(4) Total digital accuracy for thermocouple measurement: sum of digital accuracy +0.5 °C.
(5) Digital accuracy for NIST Type B T/C is ±3.0 °C (±5.4 °F) from 100 to 300 °C (212 to 572 °F).
(6) Digital accuracy for NIST Type K T/C is ±0.70 °C (±1.26 °F) from –180 to –90 °C (–292 to –130 °F).

Accuracy Example (HART devices)

When using a Pt 100 (α = 0.00385) sensor input with a 0 to 100 °C span:

- Digital accuracy = ±0.15 °C
- D/A accuracy = ±0.03% of 100 °C or ±0.03 °C
- Total accuracy = ±0.18 °C.

Accuracy Example (Foundation fieldbus devices)

When using a Pt 100 (α = 0.00385) sensor input:

- Total accuracy = ±0.15 °C.
- No D/A accuracy effects apply

Ambient Temperature Effect

TABLE 3. Ambient Temperature Effect

Sensor Options	Temperature Effects per 1.0 °C (1.8 °F) Change in Ambient Temperature(1)	Range	D/A Effect
2-, 3-, 4-wire RTDs			
Pt 100 ((α = 0.00385)	0.003 °C (0.0054 °F)	Entire Sensor Input Range	0.001% of span

Millivolt Input	0.0005 mV	Entire Sensor Input Range	0.001% of span
2-, 3-, 4-wire Ohm	0.0084 Ω	Entire Sensor Input Range	0.001% of span

(1) Change in ambient is with reference to the calibration temperature of the transmitter 68 °F (20 °C) from factory.

Transmitters can be installed in locations where the ambient temperature is between –40 and 85 °C (–40 and 185 °F). In order to maintain excellent accuracy performance, each transmitter is individually characterized over this ambient temperature range at the factory.

Temperature Effects Example (HART devices)

When using a Pt 100 (α = 0.00385) sensor input with a 0–100 °C span at 30 °C ambient temperature:

- Digital Temperature Effects: 0.003 °C x (30 - 20) = 0.03 °C
- D/A Effects: [0.001% of 100] x (30 - 20) = 0.01 °C
- Worst Case Error: Digital + D/A + Digital Temperature Effects + D/A Effects = 0.15 °C + 0.03 °C + 0.03 °C + 0.01 °C = 0.22 °C
- Total Probable Error: $\sqrt{0.15^2 + 0.03^2 + 0.03^2 + 0.01^2} = 0.16°C$

Temperature Effects Examples (Foundation fieldbus devices)

When using a Pt 100 (α = 0.00385) sensor input at 30 °C span at 30 °C ambient temperature:

- Digital Temperature Effects: 0.003 °C x (30 - 20) = 0.03 °C
- D/A Effects: No D/A effects apply
- Worst Case Error: Digital + Digital Temperature Effects = 0.15 °C + 0.03 °C = 0.18 °C
- Total Probable Error: $\sqrt{0.15^2 + 0.03^2} = 0.153°C$

Software

- No charge
- The transmitter can store up to 30 characters. If no characters are specified, the first 8 characters of the hardware tag are the default.

Considerations

Special Mounting Considerations

See “Mounting” on page A-11 for the special hardware that is available to:

- Mount a 644H to a DIN rail.
- Retrofit a new 644H to replace an existing 644H transmitter in an existing threaded sensor connection head.

External Ground Screw Assembly

Specifying option code G1 to order the external ground screw assembly. It is not necessary to order option code G1 for those approvals that include the ground screw assembly, The table below identifies which approval options include the external ground screw assembly.

Approval Type	External Ground Screw Assembly Included?
E5, K5, I5, I6, K6, NC, NA	No–Order option code G1
N1, E1, ND, I1, E7, N7, I7, I4, and E4	Yes

Configuration

Transmitter Configuration

The transmitter is available with standard configuration setting for either HART (see “Standard HART Configuration”)or FOUNDATION fieldbus (see “Standard Foundation Fieldbus Configuration”). The configuration settings and block configuration may be changed in the field with the Fisher-Rosemount Systems DeltaV®, with AMS*inside*, or other FOUNDATION fieldbus host or configuration tool.

Custom Configuration

Custom configurations are to be specified when ordering. This configuration must be the same for all sensors. The following table lists the necessary requirements to specify a custom configuration.

	Option Code	Requirements/ Specification
	C1: Factory Configuration Data (CDS required)	Date: day/month/year Descriptor: 16 alphanumeric characters Message: 32 alphanumeric character Analog Output: Alarm and saturation levels
	C2:Transmitter – Sensor Matching	The transmitters are designed to accept Callendar-Van Dusen constants from a calibrated RTD. Using these constants, the transmitter generates a custom curve to match the sensor-specific curve. Specify a Series 65, 65, or 78 RTD sensor on the order with a special characterization curve (V or X8Q4 option). These constants will be programmed into the transmitter with this option
HART only	A1: NAMUR-Compliant, High Alarm	High Alarm = 21.5 mA Upscale Saturation = 20.5 mA
HART only	CN: NAMUR-Compliant, Low Alarm	Low Alarm = 3.6 mA Downscale Saturation = 3.8 mA
	C4: Five Point Calibration	Will include 5-point calibration at 0, 25, 50, 75, and 100% analog and digital output points. Use with Calibration Certificate Q4.
	F6: 60 Hz Line Filter	Calibrated to a 60 Hz line voltage filter instead of 50 Hz filter

Standard HART Configuration

Unless specified, the transmitter will be shipped as follows:

Sensor Type	RTD, Pt 100 (α=0.00385, 4-wire)
4 mA Value	0 °C
20 mA Value	100 °C
Damping	5 seconds
Output	Linear with temperature
Failure/Saturation Modes	High (21.75 mA) / Upscale (20.5 mA)
Line Voltage Filter	50 Hz
Tag	Configuration Data Sheet requires

Standard FOUNDATION Fieldbus Configuration

Unless otherwise specified, the transmitter will be shipped as follows for all sensors:

Sensor Type: 4-wire Pt 100 (α = 0.00385) RTD

Damping: 5 seconds

Units of Measurement: °C

Line Voltage Filter: 50 Hz

Software Tag: See “Tagging”

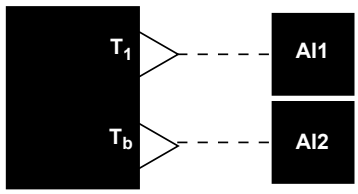
Function Blocks Tags:
- Resource Block: RB
- Transducer Block: TB
- LCD Block: LCD
- Analog Input Blocks: AI1, AI2

Alarm Range: 0

Alarm Limits of AI1 and AI2:
- HI-HI: 100 °C (212 °F)
- HI: 95 °C (203 °F)
- LO: 5 °C (41 °F)
- LO-LO: 0 °C (32 °F)

Local Display (when installed): Engineering Units of Temperature

Standard Block Configuration



Note:
T_1 = Sensor Temperature
T_b = Terminal Temperature

Final Station

AI Blocks are scheduled for 1 second. AI Blocks are linked as shown above.

STAINLESS STEEL HOUSING

The Stainless Steel Housing is ideal for Biotechnology, Pharmaceutical Industries, and Sanitary Applications

Weight

Option Code	Standard Cover	Meter Cover
S1	840 g (27 oz)	995 g (32 oz)
S2	840 g (27 oz)	995 g (32 oz)
S3	840 g (27 oz)	995 g (32 oz)
S4	840 g (27 oz)	995 g (32 oz)

Enclosure Rating

Rosemount 644 with FOUNDATION Fieldbus

The product certifications for the Rosemount 644 with FOUNDATION fieldbus are pending. Consult the factory for additional information.

North American Certifications

Factory Mutual (FM) Approvals

I5 FM Intrinsic Safety
Intrinsically Safe (Entity) / FISCO for use in Class I/II/III, Division 1, Groups A, B, C, D, E, F, and G; when installed per control drawing 00644-2075.
Temperature Code: T4A (T_{amb} = – 50 °C to 40 °C).

Nonincendive for use in Class I, Division 2, Groups A, B, C, and D.
Temperature Code: T6 (T_{amb} = – 50 °C to 70 °C);
T5 (T_{amb} = – 50 °C to 85 °C)

E5 FM Explosion-Proof:
Explosion-Proof for Class I, Division 1, Groups B, C, and D. Dust Ignition Proof for Class II/III, Division 1, Groups E, F, G when installed per Rosemount Drawing 00644-1049.
Temperature Code: T5 (T_{amb}= –50°C to 85°C)

Canadian Standards Association (CSA) Approvals

I6 CSA Intrinsic Safety
Intrinsically Safe for Class I, Division 1, Groups A,B,C, and D when installed in accordance with Rosemount drawing 00644-2076.
Temperature Code: T4 (T_{amb} = –50 °C to 60 °C)

K6 CSA Intrinsic Safety, Explosion–Proof, and Non-incendive.
Combination of I6 and Explosion–proof for Class I, Division 1, Groups B, C, and D; Dust-ignition proof for Class II, Division 1, Groups E, F, and G; Class III, Division 1 hazardous locations, when installed in accordance with Rosemount drawing 00644–1059.
Temperature Code: T4 (T_{amb} = –50 °C to 85 °C)
Suitable for Class I, Division 2, Groups B, C, and D when installed in a suitable enclosure.
Temperature Code: Temperature Code: T4 (T_{amb} = –50 °C to 60 °C);
T5 (T_{amb} = –50 °C to 85 °C)

NOTE

K6 is only available with 644H option code J6.

BASIC SETUP

RESOURCE BLOCK

This section contains information on the 644 Resource Block. Descriptions of all Resource Block Parameters, errors, and diagnostics are included. Also the modes, alarm detection, status handling, and troubleshooting are discussed.

Definition

The resource block defines the physical resources of the device. The resource block also handles functionality that is common across multiple blocks. The block has no linkable inputs or outputs.

Parameters and Descriptions

The table below lists all of the configurable parameters of the Resource Block, including the descriptions and index numbers for each.

Parameter	Index Number	Description
ACK_OPTION	38	Selection of whether alarms associated with the function block will be automatically acknowledged.
ADVISE_ACTIVE	82	Enumerated list of advisory conditions within a device.
ADVISE_ALM	83	Alarm indicating advisory alarms. These conditions do not have a direct impact on the process or device integrity.
ADVISE_ENABLE	80	Enabled ADVISE_ALM alarm conditions. Corresponds bit for bit to the ADVISE_ACTIVE. A bit on means that the corresponding alarm condition is enabled and will be detected. A bit off means the corresponding alarm condition is disabled and will not be detected.
ADVISE_MASK	81	Mask of ADVISE_ALM. Corresponds bit of bit to ADVISE_ACTIVE. A bit on means that the condition is masked out from alarming.
ADVISE_PRI	79	Designates the alarming priority of the ADVISE_ALM
ALARM_SUM	37	The current alert status, unacknowledged states, unreported states, and disabled states of the alarms associated with the function block.
ALERT_KEY	04	The identification number of the plant unit.
BLOCK_ALM	36	The block alarm is used for all configuration, hardware, connection failure or system problems in the block. The cause of the alert is entered in the subcode field. The first alert to become active will set the Active status in the Status parameter. As soon as the Unreported status is cleared by the alert reporting task, another block alert may be reported without clearing the Active status, if the subcode has changed.
BLOCK_ERR	06	This parameter reflects the error status associated with the hardware or software components associated with a block. It is a bit string, so that multiple errors may be shown.
CLR_FSTATE	30	Writing a Clear to this parameter will clear the device FAIL_SAFE if the field condition has cleared.
CONFIRM_TIME	33	The time the resource will wait for confirmation of receipt of a report before trying again. Retry will not happen when CONFIRM_TIME=0.
CYCLE_SEL	20	Used to select the block execution method for this resource. The 644 supports the following: Scheduled: Blocks are only executed based on the function block schedule. Block Execution: A block may be executed by linking to another blocks completion.
CYCLE_TYPE	19	Identifies the block execution methods available for this resource.
DD_RESOURCE	09	String identifying the tag of the resource which contains the Device Description for this resource.
DD_REV	13	Revision of the DD associated with the resource - used by an interface device to locate the DD file for the resource.
DEFINE_WRITE_LOCK	60	Allows the operator to select how WRITE_LOCK behaves. The initial value is “lock everything”. If the value is set to “lock only physical device” then the resource and transducer blocks of the device will be locked but changes to function blocks will be allowed.
DETAILED_STATUS	55	Indicateds the state of the transmitter. See Resource Block detailed status codes.
DEV_REV	12	Manufacturer revision number associated with the resource - used by an interface device to locate the DD file for the resource.
DEV_STRING	43	This is used to load new licensing into the device. The value can be written but will always read back with a value of 0.
DEV_TYPE	11	Manufacturer’s model number associated with the resource - used by interface devices to locate the DD file for the resource.
DIAG_OPTIONS	46	Indicates which diagnostics licensing options are enabled.
DISTRIBUTOR	42	Reserved for use as distributor ID. No Foundation enumerations defined at this time.
DOWNLOAD_MODE	67	Gives access to the boot block code for over-the-wire downloads. 0 = Uninitialized 1 = Run mode 2 = Download mode

Parameter	Index Number	Description
FAULT_STATE	28	Condition set by loss of communication to an output block, fault promoted to an output block or physical contact. When FAIL_SAFE condition is set, then output function blocks will perform their FAIL_SAFE actions.
FAILED_ACTIVE	72	Enumerated list of failure conditions within a device.
FAILED_ALM	73	Alarm indicating a failure within a device which makes the device non-operational.
FAILED_ENABLE	70	Enabled FAILED_ALM alarm conditions. Corresponds bit for bit to the FAILED_ACTIVE. A bit on means that the corresponding alarm condition is enabled and will be detected. A bit off means the corresponding alarm condition is disabled and will not be detected.
FAILED_MASK	71	Mask of FAILED_ALM. Corresponds bit of bit to FAILED_ACTIVE. A bit on means that the condition is masked out from alarming.
FAILED_PRI	69	Designates the alarming priority of the FAILED_ALM.
FB_OPTIONS	45	Indicates which function block licensing options are enabled.
FEATURES	17	Used to show supported resource block options. See Error! Reference source not found. The supported features are: SOFT_WRITE_LOCK_SUPPORT, HARD_WRITE_LOCK_SUPPORT, REPORTS, and UNICODE
FEATURE_SEL	18	Used to select resource block options.
FINAL_ASSY_NUM	54	The same final assembly number placed on the neck label.
FREE_SPACE	24	Percent of memory available for further configuration. Zero in a preconfigured device.
FREE_TIME	25	Percent of the block processing time that is free to process additional blocks.
GRANT_DENY	14	Options for controlling access of host computers and local control panels to operating, tuning, and alarm parameters of the block. Not used by device.
HARD_TYPES	15	The types of hardware available as channel numbers.
HARDWARE_REV	52	Hardware revision of the hardware that has the resource block in it.
ITK_VER	41	Major revision number of the inter operability test case used in certifying this device as interoperable. The format and range are controlled by the Fieldbus Foundation.
LIM_NOTIFY	32	Maximum number of unconfirmed alert notify messages allowed.
MAINT_ACTIVE	77	Enumerated list of maintenance conditions within a device.
MAINT_ALM	78	Alarm indicating the device needs maintenance soon. If the condition is ignored, the device will eventually fail.
MAINT_ENABLE	75	Enabled MAINT_ALM alarm conditions. Corresponds bit for bit to the MAINT_ACTIVE. A bit on means that the corresponding alarm condition is enabled and will be detected. A bit off means the corresponding alarm condition is disabled and will not be detected.
MAINT_MASK	76	Mask of MAINT_ALM. Corresponds bit of bit to MAINT_ACTIVE. A bit on means that the condition is masked out from alarming.
MAINT_PRI	74	Designates the alarming priority of the MAINT_ALM
MANUFAC_ID	10	Manufacturer identification number – used by an interface device to locate the DD file for the resource.
MAX_NOTIFY	31	Maximum number of unconfirmed notify messages possible.
MEMORY_SIZE	22	Available configuration memory in the empty resource. To be checked before attempting a download.
MESSAGE_DATE	57	Date associated with the MESSAGE_TEXT parameter.
MESSAGE_TEXT	58	Used to indicate changes made by the user to the device's installation, configuration, or calibration.
MIN_CYCLE_T	21	Time duration of the shortest cycle interval of which the resource is capable.
MISC_OPTIONS	47	Indicates which miscellaneous licensing options are enabled.
MODE_BLK	05	The actual, target, permitted, and normal modes of the block: Target: The mode to “go to” Actual: The mode the “block is currently in” Permitted: Allowed modes that target may take on Normal: Most common mode for actual
NV_CYCLE_T	23	Minimum time interval specified by the manufacturer for writing copies of NV parameters to non-volatile memory. Zero means it will never be automatically copied. At the end of NV_CYCLE_T, only those parameters which have changed need to be updated in NVRAM.
OUTPUT_BOARD_SN	53	Output board serial number.

Parameter	Index Number	Description
RB_SFTWR_REV_ALL	51	The string will contains the following fields: Major rev: 1-3 characters, decimal number 0-255 Minor rev: 1-3 characters, decimal number 0-255 Build rev: 1-5 characters, decimal number 0-255 Time of build: 8 characters, xx:xx:xx, military time Day of week of build: 3 characters, Sun, Mon,... Month of build: 3 characters, Jan, Feb. Day of month of build: 1-2 characters, decimal number 1-31 Year of build: 4 characters, decimal Builder: 7 characters, login name of builder
RB_SFTWR_REV_BUILD	50	Build of software that the resource block was created with.
RB_SFTWR_REV_MAJOR	48	Major revision of software that the resource block was created with.
RB_SFTWR_REV_MINOR	49	Minor revision of software that the resource block was created with.
RECOMMENDED_ACTION	68	Enumerated list of recommended actions displayed with a device alert.
RESTART	16	Allows a manual restart to be initiated. Several degrees of restart are possible. They are the following: 1 Run – nominal state when not restarting 2 Restart resource – not used 3 Restart with defaults – set parameters to default values. See START_WITH_DEFAULTS below for which parameters are set. 4 Restart processor – does a warm start of CPU.
RS_STATE	07	State of the function block application state machine.
SAVE_CONFIG_BLOCKS	62	Number of EEPROM blocks that have been modified since last burn. This value will count down to zero when the configuration is saved.
SAVE_CONFIG_NOW	61	Allows the user to optionally save all non-volatile information immediately.
SECURITY_IO	65	Status of security switch.
SELF_TEST	59	Instructs resource block to perform self-test. Tests are device specific.
SET_FSTATE	29	Allows the FAIL_SAFE condition to be manually initiated by selecting Set.
SHED_RCAS	26	Time duration at which to give up on computer writes to function block RCas locations. Shed from RCas shall never happen when SHED_ROUT = 0
SHED_ROUT	27	Time duration at which to give up on computer writes to function block ROut locations. Shed from ROut shall never happen when SHED_ROUT = 0
SIMULATE_IO	64	Status of simulate switch.
SIMULATE_STATE	66	The state of the simulate switch: 0 = Uninitialized 1 = Switch off, simulation not allowed 2 = Switch on, simulation not allowed (need to cycle jumper/switch) 3 = Switch on, simulation allowed
ST_REV	01	The revision level of the static data associated with the function block.
START_WITH_DEFAULTS	63	0 = Uninitialized 1 = do not power-up with NV defaults 2 = power-up with default node address 3 = power-up with default pd_tag and node address 4 = power-up with default data for the entire communications stack (no application data)
STRATEGY	03	The strategy field can be used to identify grouping of blocks.
SUMMARY_STATUS	56	An enumerated value of repair analysis.
TAG_DESC	02	The user description of the intended application of the block.
TEST_RW	08	Read/write test parameter - used only for conformance testing.
UPDATE_EVT	35	This alert is generated by any change to the static data.
WRITE_ALM	40	This alert is generated if the write lock parameter is cleared.
WRITE_LOCK	34	If set, no writes from anywhere are allowed, except to clear WRITE_LOCK. Block inputs will continue to be updated.
WRITE_PRI	39	Priority of the alarm generated by clearing the write lock.
XD_OPTIONS	44	Indicates which transducer block licensing options are enabled.

SENSOR TRANSDUCER BLOCK

The transducer block contains the actual measurement data, including a pressure and temperature reading. The transducer block includes information about sensor type, engineering units, linearization, reranging, temperature compensation, and diagnostics.

Parameters and Descriptions

Parameter	Index Number	Description	Notes on how changing this parameter effects transmitter operation.
ALERT_KEY	04	The identification number of the plant unit.	No effect on operation of transmitter but may affect the way alerts are sorted on the host end.
BLOCK_ALM	08	The block alarm is used for all configuration, hardware, connection failure or system problems in the block. The cause of the alert is entered in the subcode field. The first alert to become active will set the Active status in the Status parameter. As soon as the Unreported status is cleared by the alert reporting task, another block alert may be reported without clearing the Active status, if the subcode has changed.	No effect.
BLOCK_ERR	06	This parameter reflects the error status associated with the hardware or software components associated with a block. It is a bit string, so that multiple errors may be shown.	No effect.
CAL_MIN_SPAN	18	The minimum calibration span value allowed. This minimum span information is necessary to ensure when calibration is done, the two calibrated points are not too close together.	No effect.
CAL_POINT_HI	16	The highest calibrated value.	Assigns a value to the calibration high point.
CAL_POINT_LO	17	The lowest calibrated value.	Assigns a value to the calibration low point.
CAL_UNIT	19	The device description engineering units code index for the calibration values.	Device must be calibrated using the appropriate engineering units.
COLLECTION_DIRECTORY	12	A directory that specifies the number, starting indices, and DD Item ID's of the data collections in each transducer.	No effect.
ASIC_REJECTION	42	Indicates the type of material that the drain vents on the flange are made of. See Drain Vent Material Codes.	
FACTORY_CAL_RECALL	32	Recalls the sensor calibration set at the factory.	
USER_2W_OFFSET	36	Indicates the type of material that the flange is made of. See Flange Material Codes.	
INTER_DETECT_THRESH	35	Indicates the type of flange that is attached to the device. See Flange Type Codes.	
MODE_BLK	05	The actual, target, permitted, and normal modes of the block. Target: The mode to “go to” Actual: The mode the “block is currently in” Permitted: Allowed modes that target may take on Normal: Most common mode for target	Assigns the device mode.
CALIBRATOR_MODE	33	Indicates the type of sensor module.	
PRIMARY_VALUE	14	The measured value and status available to the function block.	No effect.

Parameter	Index Number	Description	Notes on how changing this parameter effects transmitter operation.
PRIMARY_VALUE_RANGE	15	The high and low range limit values, the engineering unit code, and the number of digits to the right of the decimal point to be used to display the final value. Valid engineering units are the following: 1130 = Pa 1133 = kPa 1137 = bar 1138 = mbar 1139 = torr 1140 = atm 1141 = psi 1144 = g/cm^2 1145 = kg/cm^2 1148 = inH_2O @ 68 °F 1151 = mmH_2O @ 68 °F 1154 = ftH_2O @ 68 °F 1156 = inHg @ 0 °C 1158 = mmHg @ 0 °C	No effect.
PRIMARY_VALUE_TYPE	13	Type of measurement represented by the primary value. 107 = Differential pressure 108 = Gage pressure 109 = Absolute pressure	No effect.
SENSR_DETAILED_STATUS	37	Indicates the number of remote seals that are attached to the device. See Remote Seal Number Codes.	
CAL_VAN_DUSEN_COEFF	38	Indicates the type of remote seals that are attached to the device. See Remote Seal Type Codes.	
SECONDARY_VALUE_RANG	30	The secondary value, related to the sensor.	No effect.
SECONDARY_VALUE_UNIT	29	Engineering units to be used with SECONDARY_VALUE. 1001 °C 1002 °F	No effect.
SENSOR_CAL_DATE	25	The last date on which the calibration was performed.This is intended to reflect the calibration of that part of the sensor that is usually wetted by the process.	No effect.
SENSOR_CAL_LOC	24	The last location of the sensor calibration. This describes the physical location at which the calibration was performed.	No effect.
SENSOR_CAL_METHOD	23	The method of last sensor calibration.	No effect.
OPEN_SNSR_HOLDOFF	34	The type of last sensor calibration.	No effect.
SENSOR_CAL_WHO	26	The name of the person responsible for the last sensor calibration.	No effect.
SECONDARY_VALUE	28	Defines the type of fill fluid used in the sensor.	No effect.
SENSOR_CONNECTION	27	Defines the construction material of the isolating diaphragms.	No effect.
SENSOR_RANGE	21	The high and low range limit values, the engineering units code, and the number of digits to the right of the decimal point for the sensor.	No effect.
SENSOR_SN	22	Serial number of the sensor.	No effect.
SENSOR_TYPE	20	Type of sensor connected with the transducer block.	No effect.
ST_REV	01	The revision level of the static data associated with the function block.	No effect.

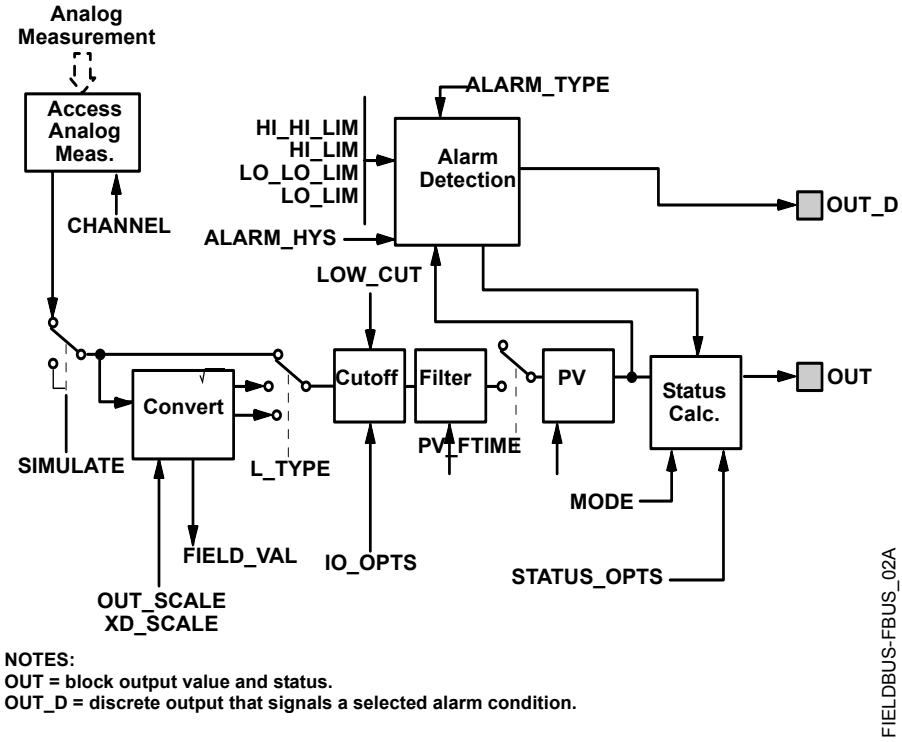
Parameter	Index Number	Description	Notes on how changing this parameter effects transmitter operation.
STRATEGY	03	The strategy field can be used to identify grouping of blocks.	No effect.
TAG_DESC	02	The user description of the intended application of the block.	No effect.
SESNOR_1_DAMPING	31	Indicates the state of the transmitter. The parameter contains specific codes relating to the transducer block and the pressure sensor specifically.	No effect.
TRANSDUCER_DIRECTORY	09	Directory that specifies the number and starting indices of the transducers in the transducer block.	No effect.
TRANSDUCER_TYPE	10	Identifies the transducer that follows.	No effect.
UPDATE_EVT	07	This alert is generated by any change to the static data.	No effect.
XD_ERROR	11	Provides additional error codes related to transducer blocks.	No effect.

ANALOG INPUT (AI) FUNCTION BLOCK

The Analog Input (AI) function block processes field device measurements and makes them available to other function blocks. The output value from the AI block is in engineering units and contains a status indicating the quality of the measurement. The measuring device may have several measurements or derived values available in different channels. Use the channel number to define the variable that the AI block processes.

The AI block supports alarming, signal scaling, signal filtering, signal status calculation, mode control, and simulation. In Automatic mode, the block's output parameter (OUT) reflects the process variable (PV) value and status. In Manual mode, OUT may be set manually. The Manual mode is reflected on the output status. A discrete output (OUT_D) is provided to indicate whether a selected alarm condition is active. Alarm detection is based on the OUT value and user specified alarm limits. Figure C-1 illustrates the internal components of the AI function block, and Table C-1 lists the AI block parameters and their units of measure, descriptions, and index numbers.

Figure C-1. AI Function Block



AI Parameter Table

Table C-1. Definitions of Analog Input Function Block System Parameters.

Parameter	Index No.	Available Values	Units	Default	Read/Write	Description
ACK_OPTION	23	0 = Auto Ack Disabled 1 = Auto Ack Enabled	None	0 all Disabled	Read and Write	Used to set auto acknowledgment of alarms.
ALARM_HYS	24	0 – 50	Percent	0.5	Read and Write	The amount the alarm value must return within the alarm limit before the associated active alarm condition clears.
ALM_SEL	38	HI_HI, HI, LO, LO_LO	None	Non selected	Read and Write	Used to select the process alarm conditions that will cause the OUT_D parameter to be set.
ALARM_SUM	22	Enable/Disable	None	Enable	Read and Write	The summary alarm is used for all process alarms in the block. The cause of the alert is entered in the subcode field. The first alert to become active will set the Active status in the Status parameter. As soon as the Unreported status is cleared by the alert reporting task, another block alert may be reported without clearing the Active status, if the subcode has changed.
ALERT_KEY	04	1 – 255	None	0	Read and Write	The identification number of the plant unit. This information may be used in the host for sorting alarms, etc.
BLOCK_ALM	21	Not applicable	None	Not applicable	Read only	The block alarm is used for all configuration, hardware, connection failure or system problems in the block. The cause of the alert is entered in the subcode field. The first alert to become active will set the Active status in the Status parameter. As soon as the Unreported status is cleared by the alert reporting task, another block alert may be reported without clearing the Active status, if the subcode has changed.
BLOCK_ERR	06	Not applicable	None	Not applicable	Read only	This parameter reflects the error status associated with the hardware or software components associated with a block. It is a bit string, so that multiple errors may be shown.
CAP_STDDEV	40	> = 0	Seconds	0	Read and Write	The time over which the VAR_INDEX is evaluated.
CHANNEL	15	1 = Pressure 2 = Housing temperature	None	AI[1]: Channel = 1 AI2: Channel = 2	Read and Write	The CHANNEL value is used to select the measurement value. Refer to the appropriate device manual for information about the specific channels available in each device. You must configure the CHANNEL parameter before you can configure the XD_SCALE parameter.
FIELD_VAL	19	0 – 100	Percent	Not applicable	Read only	The value and status from the transducer block or from the simulated input when simulation is enabled.
GRANT_DENY	12	Program Tune Alarm Local	None	Not applicable	Read and Write	Normally the operator has permission to write to parameter values, but Program or Local remove that permission and give it to the host controller or a local control panel.
HI_ALM	34	Not applicable	None	Not applicable	Read only	The HI alarm data, which includes a value of the alarm, a timestamp of occurrence and the state of the alarm.
HI_HI_ALM	33	Not applicable	None	Not applicable	Read only	The HI HI alarm data, which includes a value of the alarm, a timestamp of occurrence and the state of the alarm.
HI_HI_LIM	26	Out_Scale[2]	Out_Scale[2]	Not applicable	Read and Write	The setting for the alarm limit used to detect the HI HI alarm condition.
HI_HI_PRI	25	0 – 15	None	1	Read and Write	The priority of the HI HI alarm.
HI_LIM	28	Out_Scale[2]	Out_Scale[2]	Not applicable	Read and Write	The setting for the alarm limit used to detect the HI alarm condition.
HI_PRI	27	0 – 15	None	1	Read and Write	The priority of the HI alarm.
IO_OPTS	13	Low Cutoff Enable/Disable	None	Disable	Read and Write	Allows the selection of input/output options used to alter the PV. Low cutoff enabled is the only selectable option.

Parameter	Index No.	Available Values	Units	Default	Read/Write	Description
L_TYPE	16	Direct Indirect Indirect Square Root	None	Direct	Read and Write	Linearization type. Determines whether the field value is used directly (Direct), is converted linearly (Indirect), or is converted with the square root (Indirect Square Root).
LO_ALM	35	Not applicable	None	Not applicable	Read only	The LO alarm data, which includes a value of the alarm, a timestamp of occurrence and the state of the alarm.
LO_LIM	30	Out_Scale(2)	Out_Scale(2)	Not applicable	Read and Write	The setting for the alarm limit used to detect the LO alarm condition.
LO_LO_ALM	36	Not applicable	None	Not applicable	Read only	The LO LO alarm data, which includes a value of the alarm, a timestamp of occurrence and the state of the alarm.
LO_LO_LIM	32	Out_Scale(2)	Out_Scale(2)	Not applicable	Read and Write	The setting for the alarm limit used to detect the LO LO alarm condition.
LO_LO_PRI	31	0 – 15	None	1	Read and Write	The priority of the LO LO alarm.
LO_PRI	29	0 – 15	None	1	Read and Write	The priority of the LO alarm.
LOW_CUT	17	> = 0	Out_Scale(2)	0	Read and Write	If percentage value of transducer input fails below this, PV = 0.
MODE_BLK	05	Auto Manual Out of Service	None	Not applicable	Read and Write	The actual, target, permitted, and normal modes of the block. Target: The mode to “go to” Actual: The mode the “block is currently in” Permitted: Allowed modes that target may take on Normal: Most common mode for target
OUT	08	Out_Scale(2) ± 10%	Out_Scale(2)	Not applicable	Read and Write	The block output value and status.
OUT_D	37	Discrete_State 1 – 16	None	Disabled	Read and Write	Discrete output to indicate a selected alarm condition.
OUT_SCALE	11	Any output range	All available	none	Read and Write	The high and low scale values, engineering units code, and number of digits to the right of the decimal point associated with OUT.
PV	07	Not applicable	Out_Scale(2)	Not applicable	Read only	The process variable used in block execution.
PV_FTIME	18	> = 0	Seconds	0	Read and Write	The time constant of the first-order PV filter. It is the time required for a 63% change in the IN value.
SIMULATE	09	Not applicable	None	Disable	Read and Write	A group of data that contains the current transducer value and status, the simulated transducer value and status, and the enable/disable bit.
ST_REV	01	Not applicable	None	0	Read only	The revision level of the static data associated with the function block. The revision value will be incremented each time a static parameter value in the block is changed.
STATUS_OPTS	14	Propagate fault forward Uncertain if Limited Bad if Limited Uncertain if Man Mode		0	Read and Write	
STDDEV	39	0 – 100	Percent	0	Read and Write	The average absolute error between the PV and its previous mean value over that evaluation time defined by VAR_SCAN.
STRATEGY	03	0 – 65535	None	0	Read and Write	The strategy field can be used to identify grouping of blocks. This data is not checked or processed by the block.

Parameter	Index No.	Available Values	Units	Default	Read/Write	Description
TAG_DESC	02	32 text characters	None	none	Read and Write	The user description of the intended application of the block.
UPDATE_EVT	20	Not applicable	None	Not applicable	Read only	This alert is generated by any change to the static data.
XD_SCALE	10	Any sensor range	inH_2O (68 °F) inHg (0 °C) ftH_2O (68 °F) mmH_2O (68 °F) mmHg (0 °C) psi bar mbar g/cm^2 kg/cm^2 Pa kPa torr atm deg C deg F	AI1(1): Customer specification or inH_2O (68 °F) for DP/GP rng 1, 2, 3) or psi for DP/GP rng 4, 5 AP/644 all rng AI2 deg C		In all Rosemount devices the units of the transducer block is forced to match the unit code.

(1) The host system may write over default values pre-configured by Rosemount Inc.
(2) Assume that when L_Type = Direct, the user configures Out_Scale which is equal to XD_Scale

LCD TRANSDUCER BLOCK

Parameter	Index	Description
ALERT_KEY	4	The identification number of the plant unit.
BLK_TAG_1	15	The tag of the block containing DP1.
BLK_TAG_2	21	The tag of the block containing DP2.
BLK_TAG_3	27	The tag of the block containing DP3.
BLK_TAG_4	33	The tag of the block containing DP4.
BLK_TYPE_1	14	The enumerated block type for DP1's block.
BLK_TYPE_2	20	The enumerated block type for DP2's block.
BLK_TYPE_3	26	The enumerated block type for DP3's block.
BLK_TYPE_4	32	The enumerated block type for DP4's block.
BLOCK_ALM	8	The BLOCK_ALM is used for all configuration, hardware, connection failure or system problems in the block. The cause of the alert is entered in the subcode field. The first alert to become active will set the Active status in the Status attribute. As soon as the Unreported status is cleared by the alert reporting task, another block alert may be reported without clearing the Active status, if the subcode has changed.
BLOCK_ERR	6	This parameter reflects the error status associated with the hardware or software components associated with a block. it is a bit string, so that multiple errors may be shown.
COLLECTION_DIRECTORY	12	A directory that specifies the number, starting indicies, and DD Item ID's of the data collections in each transducer block.
CUSTOM_TAG_1	17	The block description that is displayed for DP1.
CUSTOM_TAG _2	23	The block description that is displayed for DP2.
CUSTOM_TAG _3	29	The block description that is displayed for DP3.
CUSTOM_TAG _4	35	The block description that is displayed for DP4.
CUSTOM_UNITS_1	19	This is the user entered units that are displayed when UNITS_TYPE_1=Custom.
CUSTOM_UNITS _2	25	This is the user entered units that are displayed when UNITS_TYPE_2=Custom.
CUSTOM_UNITS _3	31	This is the user entered units that are displayed when UNITS_TYPE_3=Custom.
CUSTOM_UNITS _4	37	This is the user entered units that are displayed when UNITS_TYPE_4=Custom.
DISPLAY_PARAM_SEL	13	This will determine which Display Parameters are active. Bit 0 = DP1 Bit 1 = DP2 Bit 2 = DP3 Bit 3 = DP4 Bit 4 = Bar Graph enable
MODE_BLK	5	The actual, target, permitted, and normal modes of the block.
PARAM_INDEX_1	16	The relative index of DP1 within its block.
PARAM_INDEX_2	22	The relative index of DP2 within its block.
PARAM_INDEX_3	28	The relative index of DP3 within its block.
PARAM_INDEX_4	34	The relative index of DP4 within its block.
ST_REV	1	The revision level of the static data associated with the function block.
STRATEGY	3	The strategy field can be used to identify grouping of blocks.
TAG_DESC	2	The user description of the intended application of the block.
TRANSDUCER_DIRCTORY	9	A directory that specifies the number and starting indicies of the transducers in the transducer block.
TRANSDUCER_TYPE	10	Identifies the transducer that follows.
UNITS_TYPE_1	18	This parameter determines where the units for the display parameter come from.
UNITS_TYPE_2	24	This parameter determines where the units for the display parameter come from.
UNITS_TYPE_3	30	This parameter determines where the units for the display parameter come from.
UNITS_TYPE_4	36	This parameter determines where the units for the display parameter come from.
UPDATE_EVT	7	This alert is generated by any change to the staic data.
XD_ERROR	11	Provides additional error codes related to transducer blocks.

SNL

The new SNL pillow block housings enable the full service life potential of the incorporated bearing to be exploited with less need for maintenance. Among other enhancements, the housings have increased stiffness making them even more insensitive to uncontrolled and excessive tightening of the attachment bolts.

SAF
FSAF
SAFS

Standard SAF pillow blocks are made of cast iron with either self-aligning double row ball bearings for normal loads or self-aligning spherical roller bearings for heavy loads. Standard with triple ring seal. Alternative sealing arrangements such as taconite or contact seals are available.
SAFS: Same features, cast in steel.

SNH (Replaced by SNL)

SNH pillow blocks of cast iron with either self-aligning double roll ball bearing for normal loads or self-aligning spherical roller bearing for heavy loads. A variety of different sealing arrangements are available.

SSNHD

SSNHD pillow blocks feature the same sealing arrangements as SNH pillow blocks but the base is kept blank so mounting holes in the base can be drilled and machined for two or four bolt mounting. For added strength SSNHD housings are cast in ductile iron.

SAFD

Interchangeable with SAF and SNCD series blocks made by SKF and their competition. Supplied in ductile iron as standard and stronger than the old designs. These new housings will accommodate the old designs. The new housings will accommodate the standard LER triple ring seals and in addition, a new taconite service seal can be used with the same housing. Increased load capacity can be provided by specifying the 232 series bearing for which the new block has been designed as well as the 222 series. This block utilizes the same components, specifically adapter sleeves and fixing rings, as our popular SNL/ SNH series blocks.

SNCD

Canadian designed pillow blocks made of ductile iron. A variety of sealing arrangements are available but the D and E type seal are considered the standard. Excellent for extreme abrasive materials for instance taconite dust. These pillow blocks can also be supplied in steel. Consult SKF for availability.

SD

Standard SD pillow blocks are made of cast iron and designed for use with larger spherical roller bearings, shaft size 150mm (6") and up. The standard sealing arrangement is the triple ring seal.

SDAF

The SDAF pillow block is designed for applications where the loads require a housing of extra sturdy construction. SDAF pillow blocks can also be supplied in cast steel. Consult SKF for availability.

SDCD
SDCD/MC14

Canadian designed heavy duty pillow block is made of ductile iron to complement the well proven SD design. Sealing features are the same as the SD pillow block. For extreme operating conditions D and E type labyrinth seals are standard. Excellent for abrasive materials i.e. taconite dust. These pillow blocks can also be supplied in cast steel. Consult SKF for availability.

General Information and Housing Material

Some Words About SKF Pillow Blocks (Split Housing)

SKF's complete line of ball and roller bearings and pillow block housings are adaptable to every industrial purpose and offers these outstanding performance advantages:

Low Friction Characteristics
Inherent Self-Alignment
Ease of Assembly
No Adjustment
Infrequent Lubrication
Prevents Drip or Leak
No Intrusion of Abrasive and Corrosive Matter
Economical, Trouble-Free Operation

SKF bearing housings are made of grey cast iron, ductile iron and cast steel. The bearing seating of the housings is machined to tolerances such that a loose fit of the bearing outer ring is assured and in most cases the seating width is such that the bearing has axial freedom. Dimensional inaccuracies, slight positioning errors in mounting, and thermal elongation of the shaft can be accommodated in the pillow block housing itself.

Axial location of the bearings is achieved by inserting the fixing rings specified in the housing tables. If only one ring is to be used with a bearing having an adapter sleeve, the fixing ring should be positioned on the same side of the bearing as the locknut. The bearing is then displaced from its centre position in the housing by the distance equal to half the fixing rings and their designation should be stated.

Pillow block housings shown in the housing tables are horizontally split and are designated for use with self-aligning ball bearings and spherical roller bearings with either a tapered bore and mounted on an adapter sleeve or with a cylindrical bore. The elongated (slotted) bolt holes in the housing base permit slight adjustments to be made to the position of the pillow block. The housings are fitted with dowel pins, or the mating surfaces may be stepped to ensure correct location of the associated caps and bases, which are **NOT interchangeable.**

To ensure reliable function and long operational life of the bearing in the pillow block, the mating surface of the supporting component should be machined to a surface roughness of Ra=1.6 mm (63 RMS). For the flatness IT7 is recommended. When the demand is lower, IT8 can be used.

Comparison of Physical Properties of Typical Pillow Block Housing Material

SKF pillow blocks are usually made of cast iron and are mainly intended for grease lubricated ball or roller bearings. For extra heavy duty applications, ductile iron or cast steel pillow blocks are available.

MATERIAL	SPECIFICATION	ULTIMATE TENSILE STRENGTH		YIELD STRENGTH		MINIMUM ELONGATION %
		psi	Mpa	psi	Mpa	
Cast Iron	ASTM A48 Grade 35	35000	240	-	-	-
Cast Steel	ASTM A27 Grade 65-35	65000	450	34000	240	24
Ductile Iron	ASTM A536 Grade 65-45-12	65000	450	45000	310	12

The method of bearing and housing selection we recommend must only be used for general or standard applications. Where conditions such as high thrust loads, shock loads, extreme temperatures and speeds prevail, consult SKF for detailed recommendations.

SKF Pillow Block Identification

Bold = Prefix

SNL
Pillow block a split design inch and metric variety of sealing options. See page 2.

SNA
Discontinued design replaced by SNL.

SNH
Discontinued design, replaced by SNL.

SSN
Discontinued design, replaced by SSNHD which is ductile iron.

SSNHD
Same as SNL but with blank base, Materials: spheroidal cast iron (ductile iron).

SAF
Pillow block split design inch overall dimensions (North American standard) used for inch shafting. Variety of sealing arrangements available, see Page 8.
Material : Grey cast iron ASTMA 48 grade 35

SAFD
Pillow block split design inch overall dimensions (Canadian Standard) used for inch shafting. Variety of sealing arrangements available see Page 8.
Current standard product
Material: Ductile iron ASTMA 536 grade 65-45-12
Recommended for low temperatures -40°C (-40°F)

SAFS
Same as SAF dimensionally but material cast steel ASTMA 27 grade 65-35

SDAF
Pillow block split design inch overall dimensions (North American standard) heavier design than SAF. Used for inch shafting variety of sealing arrangements available, see Page 8.
Current standard product.
Material: Grey cast iron ASTMA 48 grade 35

SD
Pillow block split design metric overall dimensions can be used for metric or inch shafting (European standard) Current standard product
Available with triple ring seals only
Material: Grey cast iron GG 25 (ISO/DIS 185 grade 250)

SDD
Same as SD dimensionally but material spheroidal cast iron GGG 40 (ISO 1083-1976, 500-7)

SDCD
Pillow block split design metric overall dimensions can be used for metric or inch shafting (Canadian standard)
Current standard product
Available with triple seal rings only
Material: Ductile iron
ASTMA 536 grade 65-45-12
Recommended for low temperatures -40°C (-40°F)

SDCD/MC14
Same as SDCD dimensionally but modified to accept extreme service seals (Taconite), see Page 9

SDJC
Pillow block split design, metric overall dimensions (European standard), metric shafting. For reference only. Consult SKF for availability and technical specifications.

SNCD
Discontinued Canadian designed pillow block, dimensionally interchangeable with SAFD. Pillow block split design inch overall dimension can be used for metric or inch shafting. Available with variety of sealing arrangements see Page 9.
Material: ductile iron ASTMA 536 grade 65-45-12

SNCT
Same as SNCD dimensionally but material cast steel ASTMA 27 grade 65-35

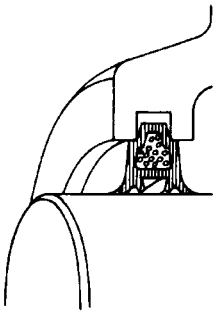
SKF Sealing Arrangements

Seals

There are many different types of seal designs for use in SKF Pillow Blocks. The many alternative choices available ensure that a correct or most suitable solution will be found to meet the condition surrounding a particular application.

If a contact (rubbing seal is selected, care must be taken with regard to the surface finish of the shaft. It is recommended that the shaft surface roughness does not exceed 125 RMS (t_a:3.2 µm ISO N8).

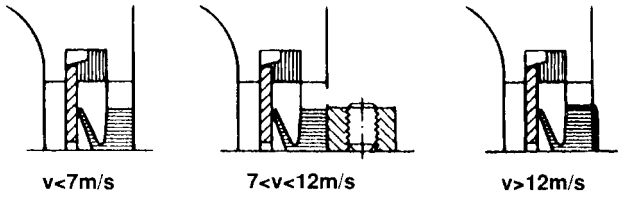
Double lip seal, Type G

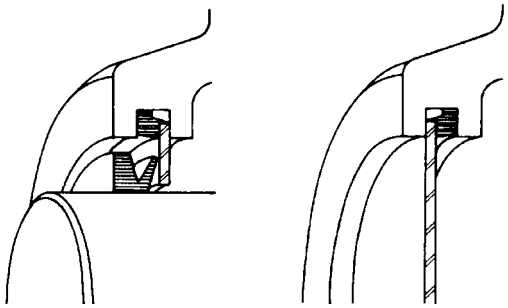


The G-seal is made of polyurethane, a wear resistant material with excellent resilience. The split design simplifies mounting. This seal can be used with grease lubrication at peripheral speeds up to 8 m/s (1600 ft/min). The maximum permissible misalignment of the shaft is approximately 1° up to shaft diameters of 100 mm (3.15/16") and 0.5° for larger sizes.

These seals can be used at temperatures between -40° and +100°C (-40° and +212°F). Double-lip seals are designated TSN followed by the housing number and suffix G, (ie. TNS 511 G).

V-Ring seals, Type A



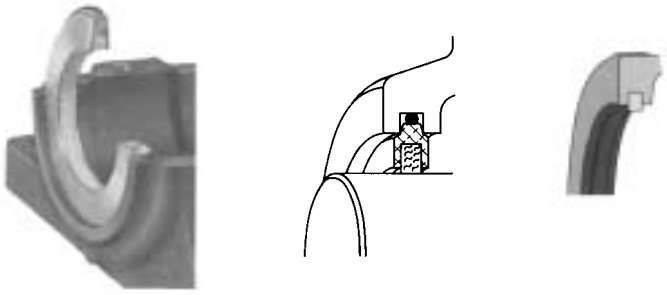


The V-Ring, of Nitrile rubber, has a thin sealing lip which functions in an axial direction. The ring also acts as a flinger as it rotates with the shaft. This type of seal can be used for both grease and oil lubrication and is extremely effective under most operating conditions including high speeds and shafts with rough sealing surfaces. V rings are normally suitable for peripheral speeds up to 7m/sec (1400 ft/min) and if axially clamped tolerate speeds up to 12m/sec (2400 ft/min). The maximum permissible misalignment of the shaft is approximately 1.5°. For a shaft diameter of 50mm, and approximately 1° for shaft diameter of 150mm.

For SNL pillow block housings, the V-rings seal against sheet metal washers which are coated with a rust inhibitor. Each washer has a rubber lip, bonded around its periphery which locates and seals in the housing groove. These seals can be used at temperatures between -40°C and +100°C (-40°F and +212°F). V-ring seals are designated TSN followed by the housing number and suffix A, for example TSN 511A.

Pillow Block Seal Arrangements

Felt Seals, Type C



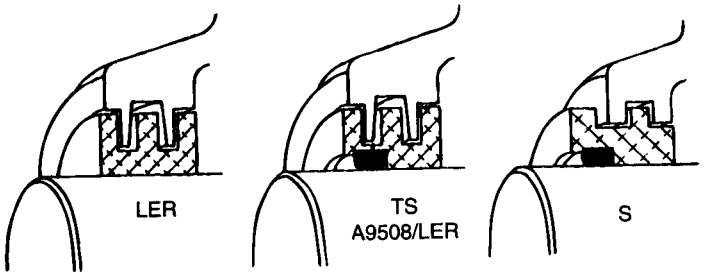
The felt seal is a simple and adequate seal which can be used with grease lubrication at peripheral speeds up to 4m/s (800 ft/min). Pillow block housings of series SNL 5 and SNL 6 are available with split felt seals consisting of oiled felt incorporated in halves of a light alloy ring, the seal halves are fitted into the housing grooves, the O-section cords provide an effective seal between the housing hub bore and the outside diameter of the seal inserts. Misalignment exceeding 0.5° would impair efficiency.

Felt seals are designated TSN followed by the housing number and suffix C, for example TSN 511 C.

Triple Ring Seals Types LOR, LORC, TS, S and A9508/LER

A labyrinth created between the rotating seal ring and its matching hub grooves results in an efficient seal, particularly if the labyrinth is filled with grease. The sliding fit of the rotating seal ring on the shaft ensures that it will automatically find its own proper location relative to the stationary hub grooves. For larger shaft diameters an O-sectioned cord is inserted between the seal ring and the shaft to ensure ring rotation and avoid possible lubricant leakage.

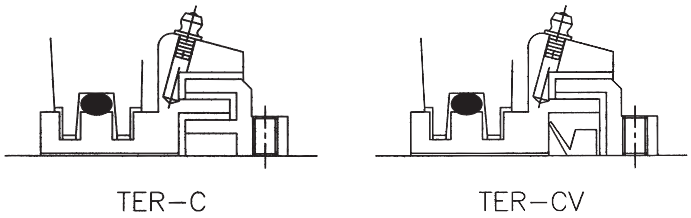
The maximum permissible misalignment between shaft and housing must be restricted to 0.25°.



Labyrinth Seal (Taconite Service Seal)

Type TER5-C and TER5-CV

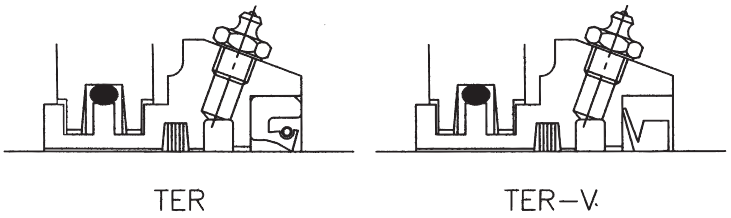
Optional Seal for SAF, SAFD, FSAF, FSAFD

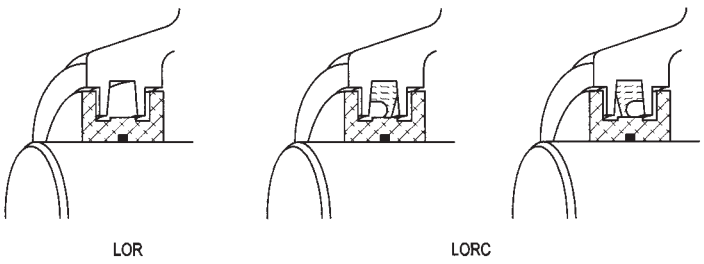


Taconite Service Seal

Type TER, and TER-V

These Taconite seals were developed as an alternative for the SAFD, SAF, SAFS and SDAF blocks without modifications having to be made. The TER and TER V with felt strip or garter spring seal are interchangeable with the TER-C and TER-CV..





Labyrinth Seals Type D and E

Extreme service seals of D and E types were initially developed for the mining industry, where fine abrasive dusts were prevalent (e.g. taconite), but have since found usage in the pulp, paper, forest and other industries where water and water laden debris prevail. They are most commonly used in the SDCD and SNL series of housing which have additional grease fitting allowing the seals to be periodically purged. Their design offers the distinct advantage that housing caps may be removed for maintenance inspection of bearings with the seals remaining undisturbed.

NOTE: Pillow Blocks SNL and SSNHD must be modified to suffix MC 106 when using TSNC-D, TSNC-E and MC14 seals.

SAFD and FSAFD must be modified to MC 14 when using TSNC-D and TSNC-E. These seals available on special order only.

Preparation before Mounting

Check shipment and make certain all assemblies are complete, and no short shipping has occurred on components.

The bearings should be left in their original packages until immediately before mounting so that they do not become dirty. Generally the preservative with which new bearings are coated before leaving the factory need only be removed from the outside cylindrical surface and bore of the bearing.

An exception is if the bearing is to be grease lubricated and used at very high or very low temperatures. In such cases the bearings should be washed and dried to prevent any detrimental effect on the lubricating properties of the greases. Bearings which have become contaminated because of improper handling (damaged package etc.) should be washed and dried before mounting.

Bearings which, when taken from their original package, have a relatively thick greasy layer of preservative, have been hot dipped and should also be washed and dried. Hot dipping is still used, principally on large-size bearings.

Clean shaft and housing*; remove all burrs and sharp edges. Check that the shaft diameter is to recommended tolerance.

Read and become familiar with the bearing mounting procedure and the installation instructions to be used for this assembly.

* NOTE: Caps and bases of housings are not interchangeable. Do not mix.

Adapter Sleeve Mounting – Spherical Roller Bearings

All spherical roller bearings with taper bore, to be mounted on adapter sleeves, have to be driven up the taper sufficiently to achieve the proper reduction of clearance.

The unmounted clearance of each bearing must be measured and recorded. Stand the bearing on the bench and insert progressively thicker feelers the full length of the roller between the unloaded roller and the outer ring at the top location. Never roll the rollers over the feelers as the wrong value will be obtained.

Position the adapter sleeve (less locknut and lockwasher) on the shaft in the correct position for the proposed bearing mounted center line. A light smear of spindle oil applied to the sleeve outside diameter, results in easier mounting/removal of bearing.

Mount bearing on adapter with the large bore side of the inner ring to match the taper on the outside diameter of the adapter. With bearing hand tight on the adapter, locate the bearing and adapter to the proper axial location on the shaft. Do not apply lockwasher. Drive up procedure could damage it. To avoid damage to the bearing it is most important during this and subsequent operations, that the shaft be blocked up so the bearing is unloaded.

Lubricate the chamfered face of the locknut and the threads (use Molykote for larger sizes), then apply locknut with chamfered face to bearing, tighten nut until sleeve is snug on the shaft. Wrenches are available for bearing drive up. For larger bearings, hydraulic mounting nuts are recommended to obtain required internal clearance reduction. Ref. page 42.

Never tighten the locknut with a hammer and drift. The locknut will be damaged and chips can enter the bearing. Continue tightening locknut and measure the internal clearance with feelers until the internal clearance is less than the recorded unmounted clearance figure by the amount shown in table on page 42. Remove locknut and install the washer with the inner prong located in the slot provided in the adapter and have the tabs facing away from the bearing. Re-apply the locknut and tighten until firmly seated against the lockwasher. If necessary tighten the locknut to a point where one of the tabs on the lock washer lines up with a slot in the locknut then bend this tab into that slot.

For a large size adapter sleeves (size 44 and up) the use of the oil injection mounting method is standard practice. For these adapter sizes the lockwasher is replaced with a lockplate. In these cases with the locknut tightened to achieve the proper reduction of internal clearance in the bearing, take lockplate and place its prong in the slot of the adapter sleeve. Note how much the locknut will have to be tightened for the holes in the locknut to align with the holes in the lockplate. Reverse the lockplate and observe how much the locknut will have to be tightened for the hole in the locknut to align with the holes in the lockplate. The lockplate is to be placed in the position requiring the least tightening to align the two sets of holes. When the locknut has been tightened to achieve this, then insert and tighten cap screws. Lock cap screws with lockwire through holes in heads. Do a final check on the mounted internal clearance of the bearing.

Adapter Sleeve Mounting Self-Aligning Ball Bearing

Position adapter sleeve (less locknut and lockwasher) on the shaft in the correct position for the proposed bearing mounted center line. A light smear of clean spindle oil applied to the sleeve outside diameter, results in easier mounting and removal of bearing.

Mount bearing on adapter with the large bore side of the inner ring to match the taper on the outside diameter of the adapter. With bearing hand tight on the adapter, relocate if necessary, the bearing and the adapter to the proper axial location on the shaft. Do not apply lockwasher. Drive up procedure could damage it. To avoid damage to the bearing it is most important during this subsequent operation that the shaft is blocked up so the bearing is not loaded.

Apply the locknut with the chamfered face toward the bearing after lubricating the face of the locknut next to the bearing. Hand tighten the nut with the spanner wrench until the adapter sleeve can neither be moved axially, nor rotated on the shaft. Then with the hammer hit the hook wrench until the locknut has been turned 90° or 1/4 turn on the adapter sleeve (varies with size).

Caution: A loose adapter sleeve can lead to the inner ring turning on the adapter sleeve and/or the adapter sleeve turning on the shaft. To insure that the nut is not excessively tight, make certain the outer ring of the bearing rotates freely.

When mounting a normal fit bearing, swiveling the outer ring will result in a slight drag. If the bearing is a C3 fit, the outer ring will swivel freely. Remove locknut and mount lockwasher with inner prong located in the slot provided in the adapter and the tabs on washer O.D. leaning away from the bearing. Re-apply locknut and tighten until firmly seated against lockwasher. Find lockwasher tab nearest one of the slots in the locknut. If slot is past tab, do not loosen nut, but tighten until a tab can be bent into a slot.

Cylindrical Bore Mounting Self-aligning Ball or Spherical Roller Bearings

Small bearings up to bore size 50mm (2in.)

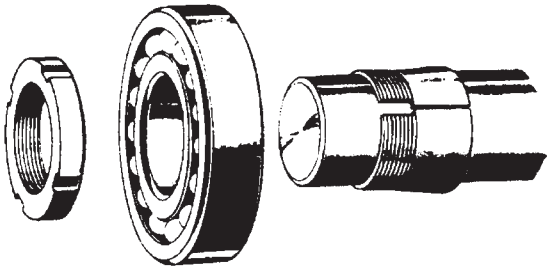
Apply a coat of light oil to the shaft and bearing bore. Fit a clean tube with one end squared and bore slightly larger than the bearing bore, against the bearing inner ring. With the bearing square on the shaft, apply pressure using a press. The bearing must be seated firmly against the shaft shoulder.

Mount lockwasher with inner prong located in the key slot provided in the shaft and tabs on washer O.D. leaning away from the bearing. Apply locknut with face lubricated, tighten with appropriate wrench until all components are locked up solid to shaft shoulder. It may be necessary to further tighten the nut to engage a washer tab with a slot in the nut. A very small movement of the nut will usually align a tab with a slot.

Large Bearings-Bore Size 50mm (2in) and larger

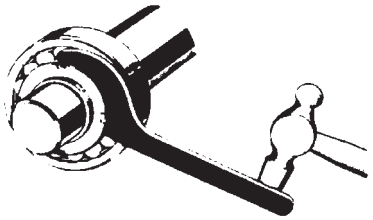
These bearings are not easily pressed on a shaft, and should therefore be heated using an induction heater, hot plate or temperature controlled oven. On very large bearings it may be necessary to use an “oil bath” using a 10%-15% mixture of soluble oil in water to approximately 100°C maximum. The bearing must be on supports to isolate it from direct contact with bottom of the tank, thereby preventing the possibility of localized overheating which could result in bearing damage. Never use an open flame to heat the bearing. Mount the bearing on the shaft firmly against the shoulder, immediately applying the locknut and tighten to prevent the bearing shrinking away from its proper position against the shoulder. When the bearing has cooled, remove the locknut and mount the lockwasher with inner prong located in the key slot provided in the shaft and the prongs on the O/D facing away from the bearing. Apply the locknut with the face lubricated and tighten with appropriate wrench until all components are locked up solid to shaft shoulder. It may be necessary to further tighten the nut to engage a washer tab with a slot in the nut, enabling the tab to be bent down into the slot in the nut. A very small movement of the nut will usually align these.

Recommended Method for Mounting Bearings

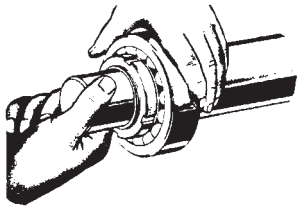


Place the bearing on the sleeve and screw on the nut with the nut chamfer toward the bearing. Tighten the nut just enough to ensure that the bearing and shaft make contact with the sleeve, but do not tighten to drive the bearing further up the sleeve.

Turn the nut with a hook spanner according to the illustration.



To achieve the right fit, turn the nut through the angle α. Then reposition the spanner 180° and tighten a few more degrees by rapping on the spanner with a hammer. SKF has a set of lock nut spanners which are clearly marked with the correct tightening gauge.



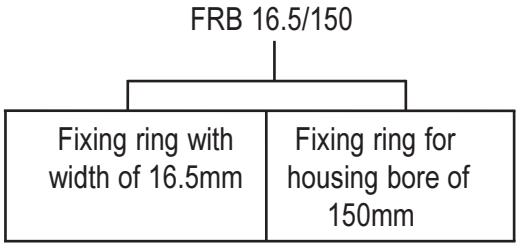
For a self-aligning bearing with normal clearance, the drive-up is correct when the outer ring easily rotates but resists swiveling. If the nut is placed inboard of the bearing, the locking washer must be mounted together with the nut. Lubricate the surfaces that slide against each other during tightening.

Special Note on Location of Bearings in Pillow Blocks

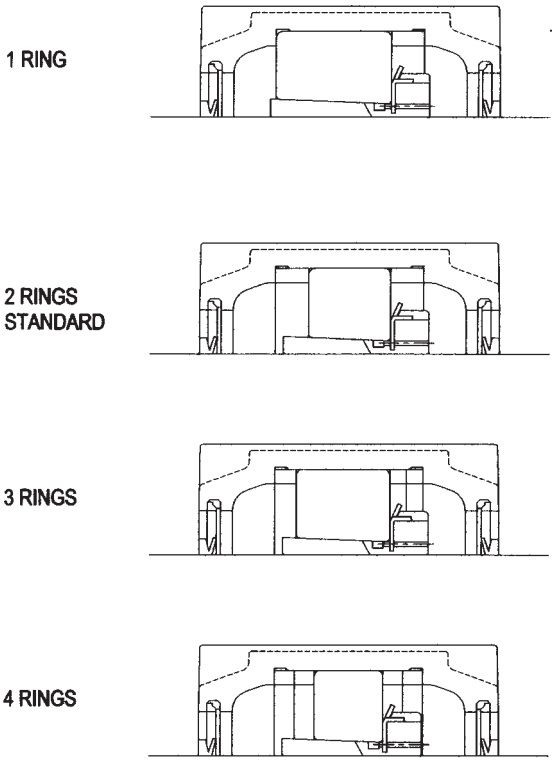
If the bearing is to be held (located), fixing rings are inserted between the side faces of the outer ring and the housing shoulders. If an adapter sleeve is used to secure the bearing to the shaft and only one fixing ring is required, it should be placed on the same side of the bearing as the locknut. The bearing is then displaced from its central position in the housing by a distance equal to half the fixing ring width.

1 ring - on the **same side as the sleeve nut**
2 rings - one on each side of the bearing
3 rings - two on the **same side as the sleeve nut**
4 rings - two on each side of the bearing

Example:

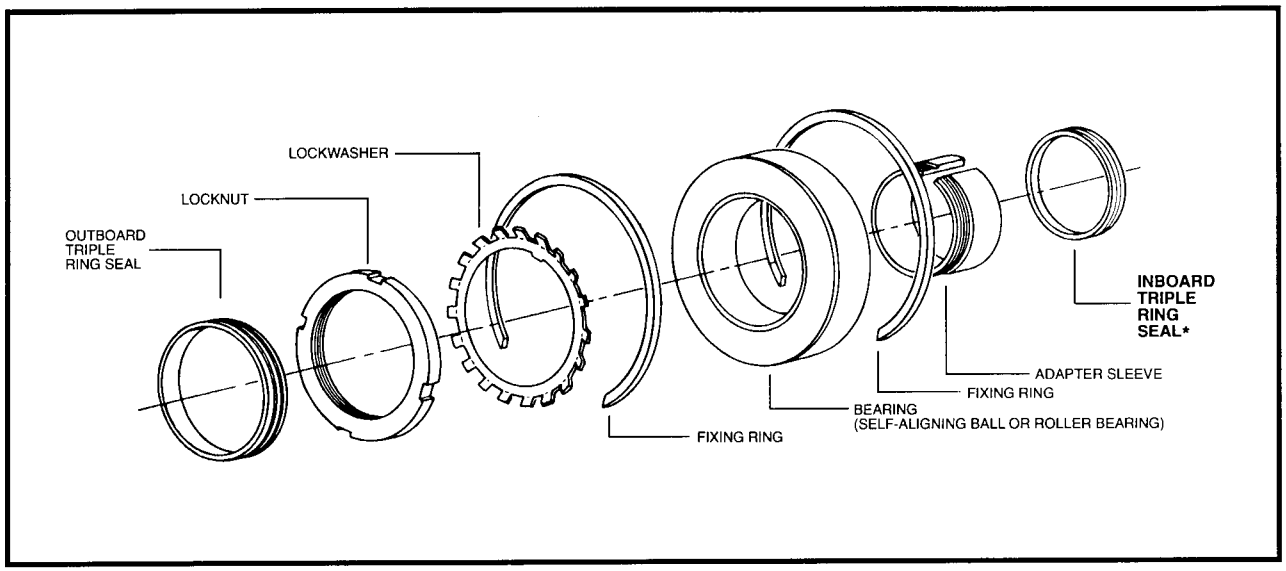


Note:
As opposed to a held bearing - a free bearing is mounted without fixing rings. The bearing positioned in the centre of the bearing seat in the pillow block housing will ensure proper lubrication as well as shaft expansion and contraction.

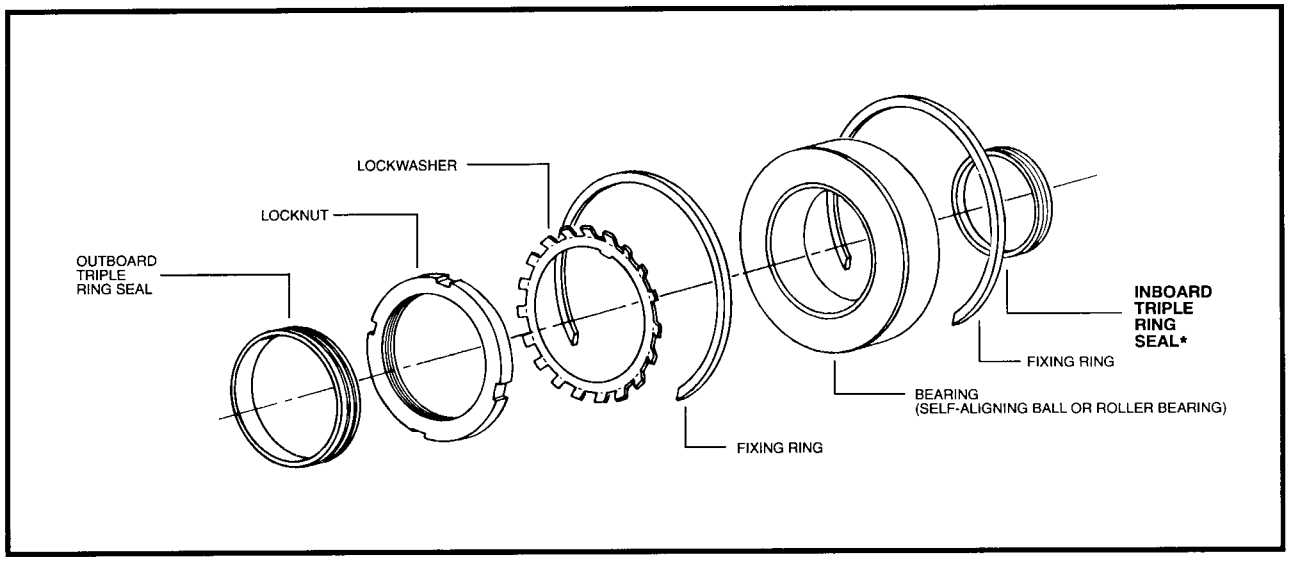


Basic Procedures For Mounting Bearings

Adapter Sleeve Mounting



Cylindrical Bore Mounting

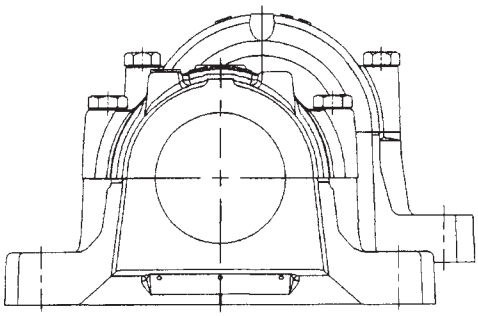


*** Note: Do not forget to mount this seal ring first!**

SKF

PILLOW BLOCK HOUSINGS

SNL, SSNHD



MATERIAL	SNL: cast iron GG20 (ISO/DIS 185 grade 200) SSNHD: Ductile iron	
BEARING SERIES USED	12K, 12EK, 13K, 22K, 22EK, 23K, 222CCK, 222EK, 223CCK, 223EK C 22K, C 23K, C 32K	
SHAFT SIZE RANGE	3/4" to 5-1/2"	20mm to 140mm
PILLOW BLOCK SIZE	505 - 532 (adapter mounting)	
PILLOW BLOCK LUBRICATION	Grease (for oil lubrication consult SKF)	
STANDARD SEALS	TSN-G 	
OPTIONAL SEALS	TSN-A 	TSN-C 	TSN-S 	TSNC-D 	TSNC-E 	TSNC/MC17 	Taconite TSN-ND 	

Note : Pillow Block SNL & SSNHD must be modified to MC106 when using TSNC-D & E for sizes 520 through 532 and TSNC/MC17 for sizes 515 through 518.

Seal assembly and Mounting Procedure

G-Type Seal

1. The housing base is placed in position and the mounting bolts loosely fitted.

2. The halves of the seals are inserted in the housing grooves and the spaces between the lips of the seals are filled with grease.

3. The bearing is mounted on the shaft (directly or on an adapter sleeve) and filled with grease.

4. The shaft, complete with bearing assembly, is placed in the lower half of the housing.

5. For held unit, fixing rings are placed in position. For free unit, bearing must be located in center of bearing seat of housing for proper lubrication.

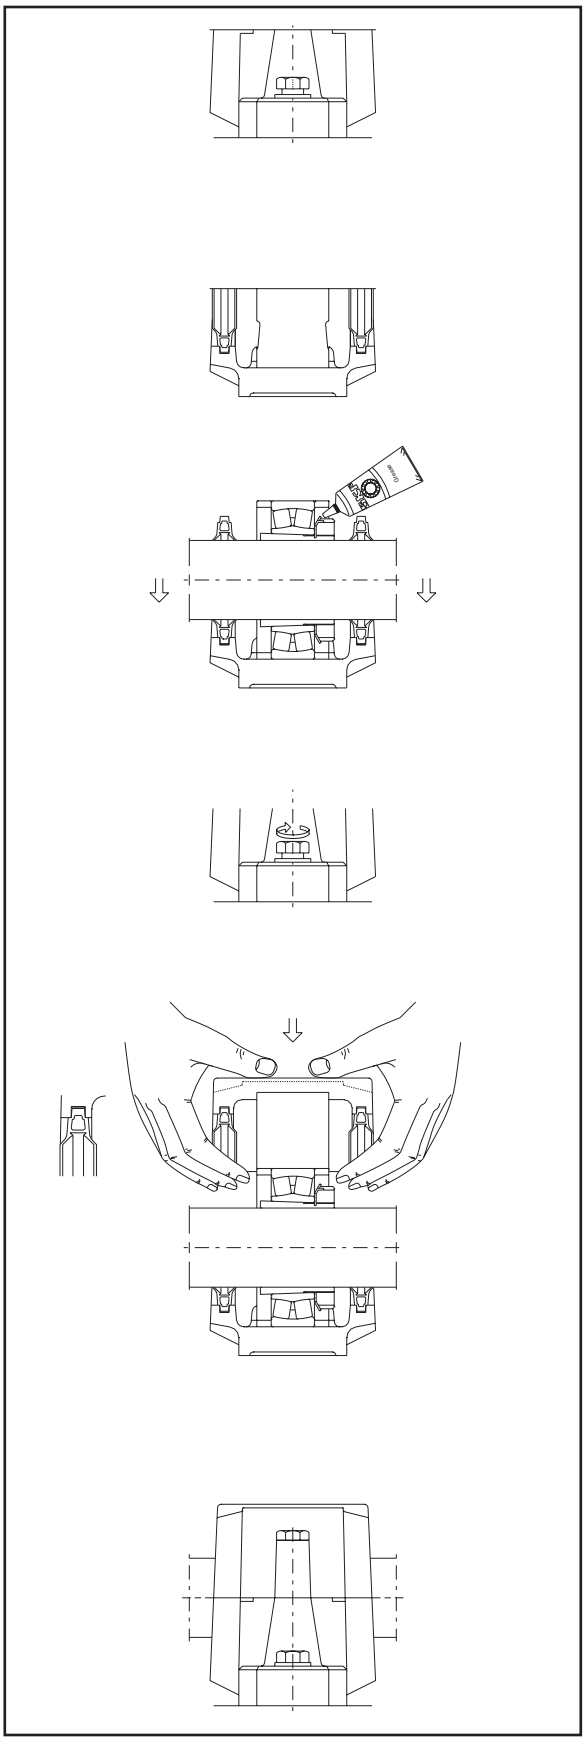
6. The housing base is checked for alignment, ensuring that it is within acceptable limits, and the mounting bolts are then slightly tightened.

7. The other halves of the seals are inserted in the cap and the space between the lips of the seals filled with grease. For sizes 528-532 and 616-620 the seal halves must be turned so that the spigots fit in the holes of the connecting seal halves.

8. At the first charge of grease, the bearing MUST be filled with grease (do not wash out the protective coating) and the housing will be filled one-third full. For greasing quantities, refer to Page 40.

9. The housing cap is fitted and the cap bolts tightened to the recommended torque, see table on Pages 26 through 37. Note that the cap **must not be interchanged** with that of other housings.

10. Finally the housing mounting bolts are tightened to the support.



Seal Assembly and Mounting Procedure

V-Ring Seal Type “A”

1. The housing base is placed in position and the mounting bolts loosely fitted.

2. One V-ring and one sheet metal washer are placed on the shaft. Care should be taken to position these correctly in relation to the housing. Do not allow the V-ring seal lip to pass through the sheet metal washer.

3. The bearing is mounted on the shaft (directly or on an adapter sleeve) and filled with grease.

4. The second V-ring and sealing washer are placed on the shaft.

5. The shaft, complete with bearing assembly and sealing components, is placed in the lower half of the housing.

6. For held unit, fixing rings are placed in position. For free unit, bearing must be located in center of bearing seat of housing for proper lubrication.

7. The housing base is checked for alignment, ensuring that it is within acceptable limits, and the mounting bolts are then slightly tightened.

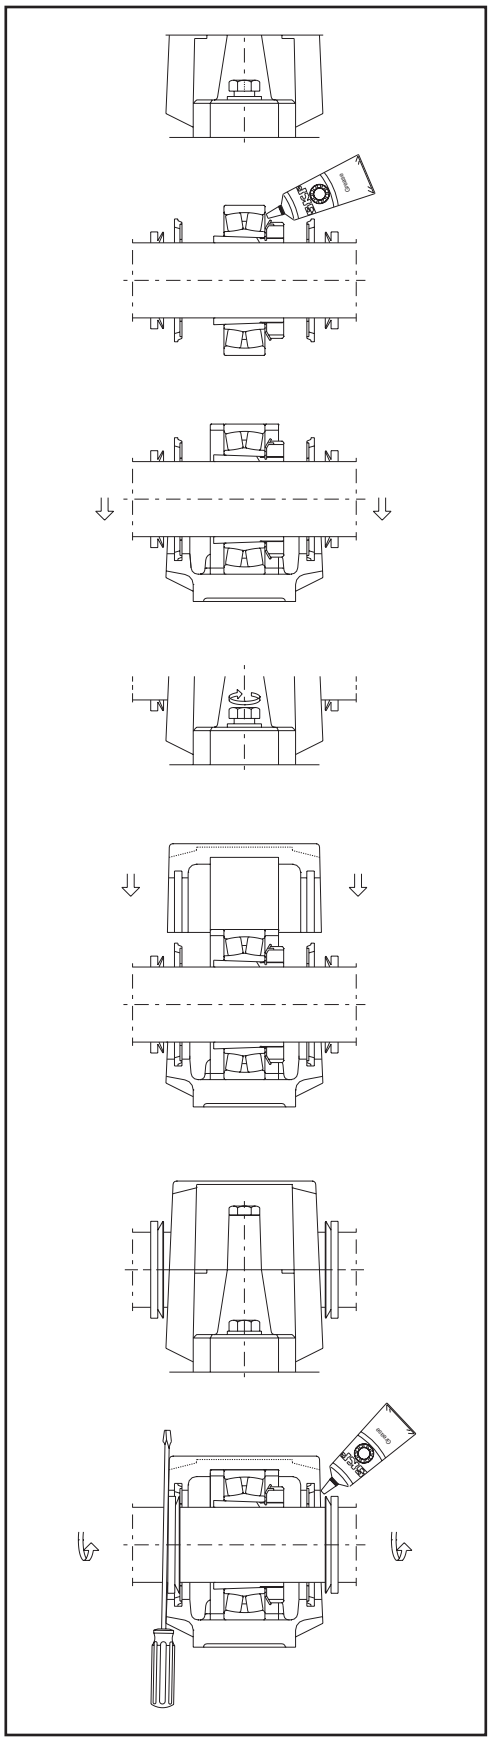
8. At the first charge of grease, the bearing must be filled with grease (do not wash out the protective coating) and the housing will be filled one-third full. For greasing quantities, refer to Page 40.

9. The housing cap is fitted and the cap bolts tightened to the recommended torque, see table on Pages 26 through 37. Note that the cap **must not be interchanged** with that of another housing.

10. The mounting bolts are tightened to the support.

11. The outer surfaces of the sealing washers are smeared with grease.

12. Finally the V-rings are pushed axially along the shaft until their sealing lips are aligned and in the correct working position relative to the sealing washer. The simplest way to move the V-rings is to use a screwdriver blade while rotating the shaft by hand. V-ring seals may be used for oil lubrication. The assembly shown at the right is for grease. When V-rings are used for oil, the seals are doubled up. Consult SKF for more detail.



Seal Assembly and Mounting Procedure

Felt Seal Type “C”

1. The housing base is placed in position and the attachment bolts loosely fitted.

2. The rubber O-section cords are placed in the grooves in the housing base.

3. The halves of the alloy ring with felt seals are mounted on the O-section cords in the grooves of the housing base.

4. The bearing is mounted on the shaft (directly or on an adapter sleeve) and filled with grease.

5. The shaft, complete with bearing assembly, is placed in the lower half of the housing.

6. For held unit, fixing rings are placed in position. For free unit, bearing must be located in center of bearing seat of housing for proper lubrication.

7. The housing base is checked for alignment, ensuring that the housing is within acceptable limits, and the mounting bolts are then slightly tightened.

8. The rubber O-section cords are placed in the grooves in the housing cap.

9. The felt seals with the light alloy rings are mounted on the O-section cords in the grooves of the housing cap.

10. At the first charge of grease, the bearing MUST be filled with grease (do not wash out the protective coating) and the housing will be filled one-third full. For greasing quantities, refer to Page 40.

11. The housing cap is fitted and the cap bolts tightened to the recommended torque, see table on Pages 26 through 37. The seals in the housing cap are held in position while the cap is fitted on the housing base. Note that the cap **must not be interchanged** with that of another housing.

12. Finally, the mounting bolts are tightened to the support.

Seal Assembly And Mounting Procedure
Triple Ring Seal “LOR, LORC and A 9508/LER”

1. The housing base is placed in position and the mounting bolts loosely fitted.

2. One labyrinth seal is placed on the shaft.

3. The bearing is mounted on the shaft (directly or on an adapter sleeve) and filled with grease.

4. The second labyrinth seal is placed on the shaft.

5. The shaft, complete with bearing assembly and labyrinth seals, is placed in the lower half of the housing.

6. For held unit, fixing rings are placed in position. For free unit, bearing must be located in center of bearing seat of housing for proper lubrication.

7. The housing base is checked for alignment, ensuring that it is within acceptable limits, and the mounting bolts are then slightly tightened.

8. At the first charge of grease, the bearing MUST be filled with grease (do not wash out the protective coating) and the housing will be filled one-third full. For greasing quantities, refer to Page 40.

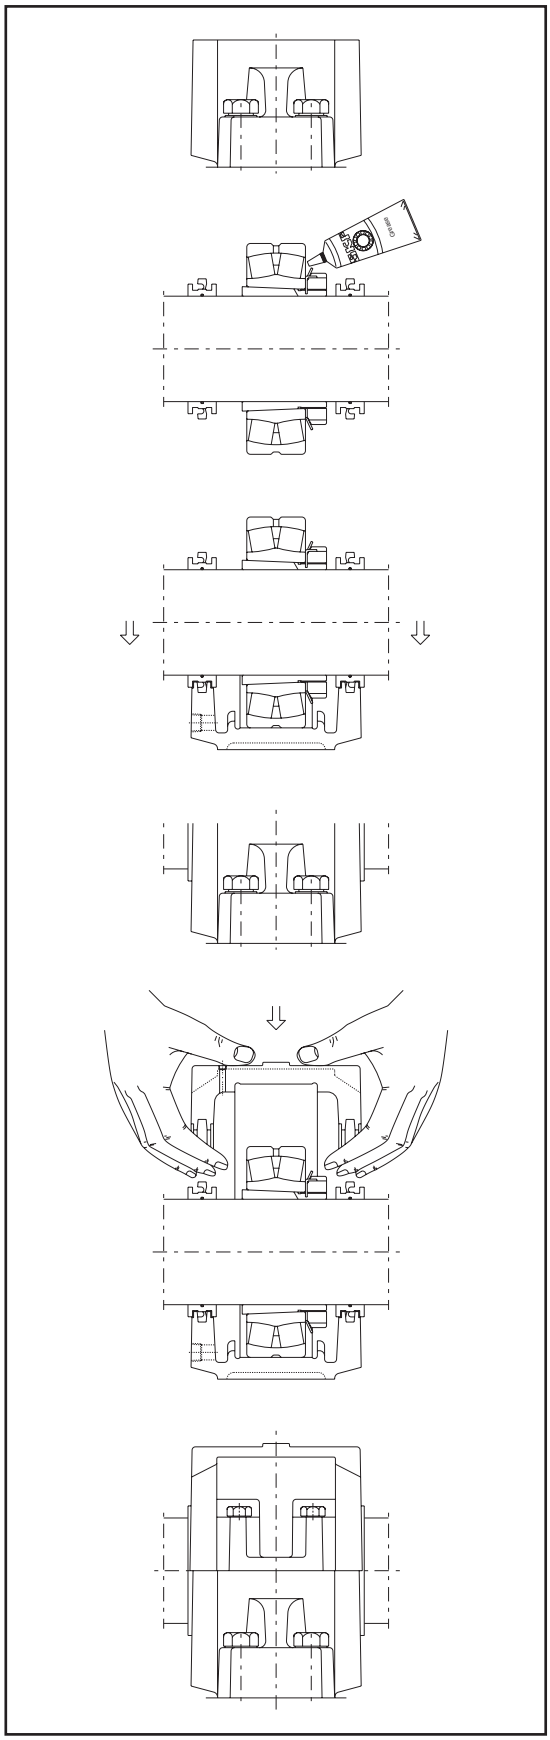
9. The housing cap is fitted and the cap bolts tightened to the recommended torque, see table on Pages 26 through 37. Note that the cap **must not be interchanged** with that of another housing.

10. The mounting bolts are tightened to the support.

11. Finally the silicon O-ring is placed in the grooves of the labyrinth seals. The simplest way to mount the O-ring is to use a screwdriver blade while rotating the shaft by hand.

12. For the LORC seal insert the inboard LOR seal with the added sealing component assuring that the rubber sealing component is facing in the correct orientation to make it either purgeable or non-purgeable.

NOTE: Instruction 11 is only required for A9508/LER Labyrinth Seal.



Seal Assembly and Mounting Procedure
Labyrinth Seals Type “TER-C”

1. The housing base is placed in position and the mounting bolts loosely fitted.

2. Slide one labyrinth seal, consisting of labyrinth flinger, with prongs pointed towards bearing location and labyrinth insert with O-ring installed on its O.D., in this order, on the shaft.

3. The bearing is mounted on the shaft (directly or on an adapter) and filled with grease.

4. The second labyrinth seal is placed on the shaft following instruction as described above under 2 except reverse sequence.

5. The shaft, complete with bearing assembly and labyrinth seal assemblies, is placed in the lower half of the housing.

6. For held unit, fixing rings are placed in position. For free unit, bearing must be located in center of bearing seat of housing for proper lubrication.

7. The housing base is checked for alignment, ensuring that is within acceptable limits, and the mounting bolts are then slightly tightened.

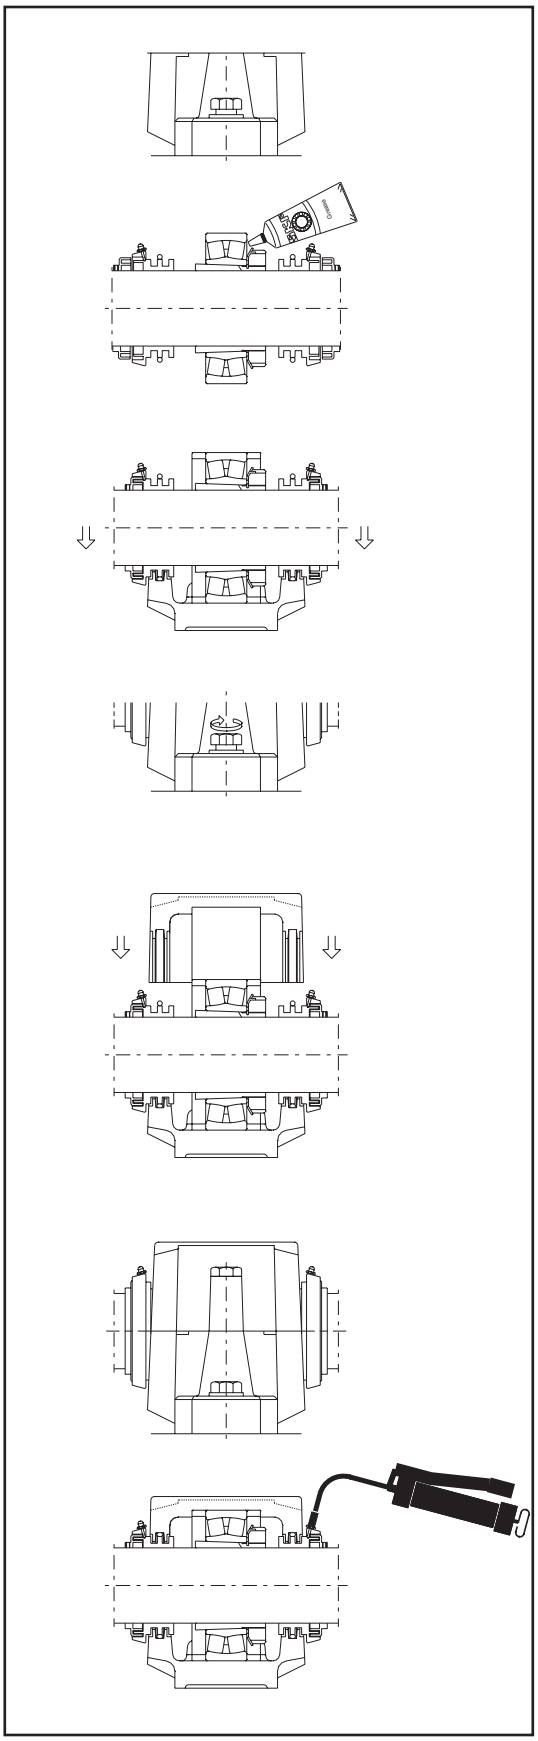
8. The housing must be filled 1/3 full with grease, by packing the free space on both sides of the bearing. See page 40. (Do not wash out the protective coating).

9. The housing cap is fitted, being careful not to damage the O-rings on the O.D. of the seal rings, and the cap bolts tightened to the recommended torque, see Tables on Pages 26 through 37. Note that the cap **must not be interchanged** with that of another housing. Also if shimming is required, only shims giving full mounting support must be used.

10. The mounting bolts are tightened to the support.

11. Fill seal labyrinth on insert and flinger with grease.

12. To adjust labyrinth seal flingers, move the flingers axially toward housing till they contact insert. Back flinger off 1/16” (1.6 mm) on “HELD” assembly. For “FREE” assembly back off the amount of the expected shaft expansion plus 1/32” (0.8 mm). Tighten the setscrews.



Seal Assembly and Mounting Procedure
Labyrinth Seals Type “TER-CV”

1. The housing base is placed in position and the mounting bolts loosely fitted.

2. Slide one labyrinth seal, consisting of labyrinth flinger and a V-ring. Note: Make sure seal lip of V-ring is away from flinger. Point prongs of flinger and V-ring towards bearing location. Slide labyrinth insert with O-ring installed on its O.D., in this order, on the shaft.

3. The bearing is mounted on the shaft (directly or on an adapter) and filled with grease.

4. The second labyrinth seal is placed on the shaft following instruction as described above under 2, except reverse sequence.

5. The shaft, complete with bearing assembly and labyrinth seal assemblies, is placed in the lower half of the housing.

6. For held unit, fixing rings are placed in position. For free unit, bearing must be located in center of bearing seat of housing for proper lubrication.

7. The housing base is checked for alignment, ensuring that it is within acceptable limits, and the mounting bolts are then slightly tightened.

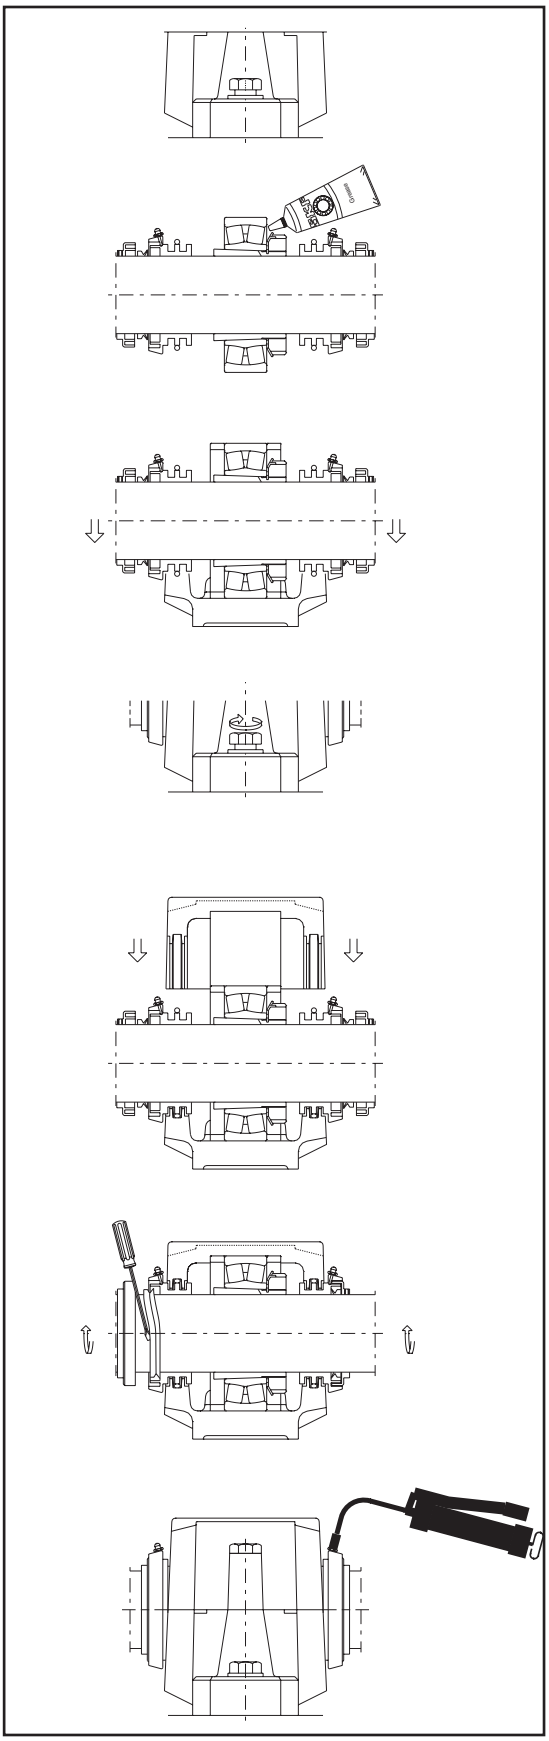
8. The housing must be filled 1/3 full with grease, by packing the free space on both sides of the bearing. See page 40. (Do not wash out the protective coating).

9. The housing cap is fitted, being careful not to damage the O-rings on the O.D. of the seal inserts, and the cap bolts tightened to the recommended torque, see Table on Pages 26 through 37. Note that the cap **must not be interchanged** with that of another housing.

10. The mounting bolts are tightened to the support.

11. Fill seal labyrinth on insert and flinger with grease.

12. To adjust labyrinth seal flingers, move the flingers axially toward housing till they contact insert. Back flinger off 1/16" (1.6 mm) on “HELD” assembly. For "FREE" assembly back off the amount of the expected shaft expansion plus 1/32” (0.8 mm). Tighten the set screws.



Seal Assembly and Mounting Procedure
Labyrinth Seal Type "S" and "TS"

1. The housing base is placed in position and the Mounting bolts loosely fitted.

2. One labyrinth seal is placed on the shaft.

3. The bearing is mounted on the shaft (directly or on an adapter sleeve) and filled with grease.

4. The second labyrinth seal is placed on the shaft.

5. The shaft, complete with bearing assembly and labyrinth seals, is placed in the lower half of the housing.

6. For held unit, fixing rings are placed in position. For free unit, bearing must be located in center of bearing seat of housing for proper lubrication.

7. The housing base is checked for alignment, ensuring that it is within acceptable limits, and the mounting bolts are then slightly tightened.

8. At the first charge of grease, the bearing MUST be filled with grease (do not wash out the protective coating) and the housing will be filled one-third full.
   * For greasing quantities, refer to Page 40.

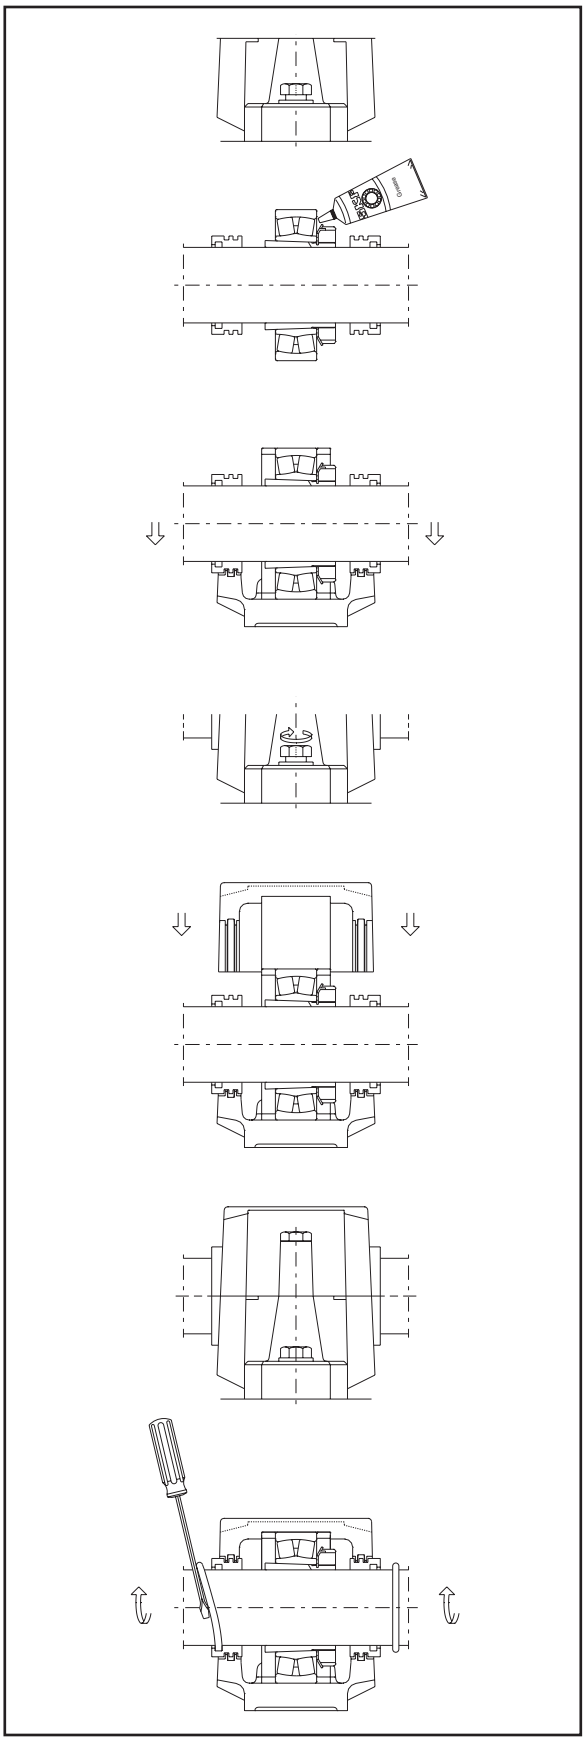
9. The housing cap is filled and the cap bolts tightened to the recommended torque, see Table on Pages 26 through 37. Note that the cap **must not be interchanged** with that of another housing.

10. The mounting bolts are tightened to the support.

11. Finally the silicon O-section cords are placed in the grooves of the labyrinth seals. The simplest way to mount the cords is to use a screwdriver blade while rotating the shaft by hand.

NOTE: Type S is used with SNH and SSNHD.
Type TS is used with SD, SDCD, SDCT and SDHD.

*The initial charge can be increased to half-full for slow to moderate speeds. For slower applications less than 10 rpm consult SKF Engineering Dept.



Seal Assembly and Mounting Procedure
Labyrinth Seals Type “E”

1. The housing base is placed in position and the mounting bolts loosely fitted.

2. Slide one labyrinth seal, consisting of labyrinth flinger, with prongs towards bearing location and labyrinth insert with O-ring installed on its O.D., in this order, on the shaft.

3. The bearing is mounted on the shaft (directly or on an adapter) and filled with grease.

4. The second labyrinth seal is placed on the shaft following instruction as described above under 2.

5. The shaft, complete with bearing assembly and labyrinth seal assemblies, is placed in the lower half of the housing.

6. For held unit, fixing rings are placed in position. For free unit, bearing must be located in center of bearing seat of housing for proper lubrication.

7. The housing base is checked for alignment, ensuring that it is within acceptable limits, and the mounting bolts are then slightly tightened.

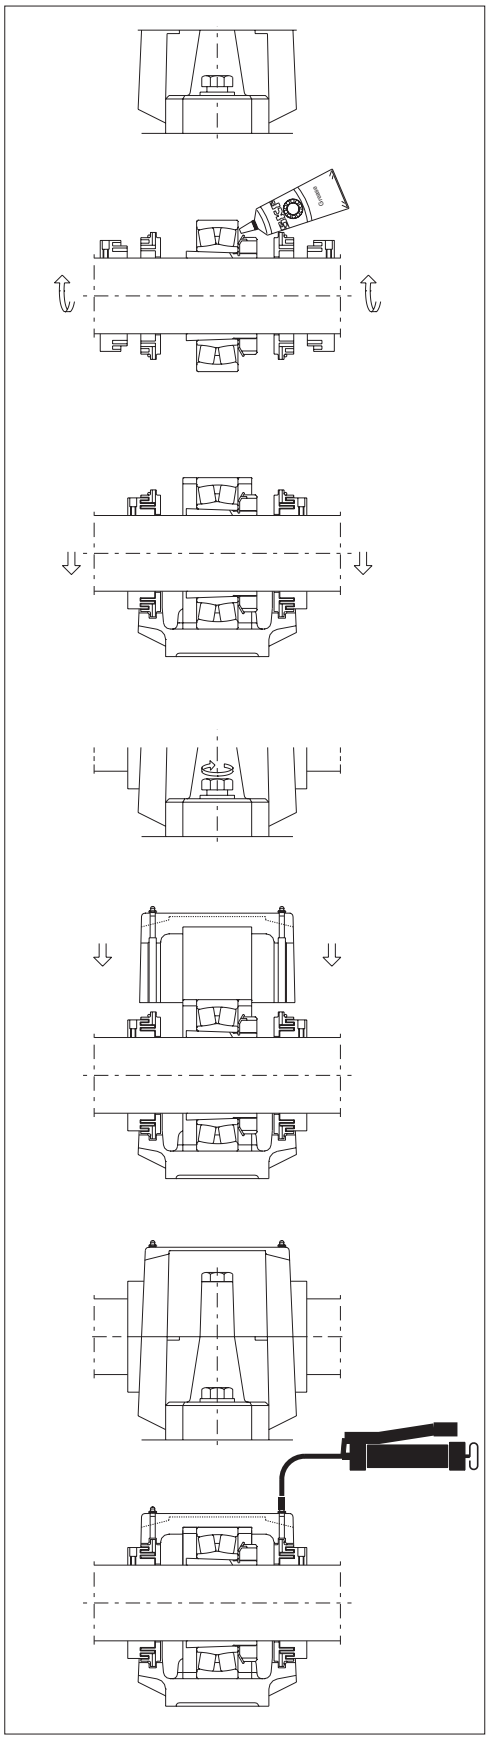
8. At the first charge of grease, the bearing MUST be filled with grease. See page 40. (do not wash out the protective coating) the housing will be filled one-third full.

9. The housing cap is fitted, being careful not to damage the O-rings on the O.D. of the seal inserts, and the cap bolts tightened to the recommended torque, see Table on Pages 26 through 37. Note that the cap **must not be interchanged** with that of another housing.

10. The mounting bolts are tightened to the support.

11. To adjust labyrinth seal flingers, move the flingers axially toward housing until they contact insert. Back flinger off 1/16” (1.6 mm) on “HELD” assembly. For "FREE" assembly back off the amount of the expected shaft expansion plus 1/32” (0.8mm). Tighten the setscrews which secure the flingers on the shaft. To complete the assembly in the case of SDCD housings with these labyrinth seal assemblies, take one half of the 4 mm rubber cord supplied and insert it in the counter bore of each flinger bore adjacent to the outer face.

12. At the initial startup, with shaft rotating, lubricate seals through grease fitting until a bead of grease appears around the periphery of the flingers. NOTE: Use same grease as for lubrication of bearing.



Seal Assembly and Mounting Procedure
Labyrinth Seals Type “D”

1. The housing base is placed in position and the mounting bolts loosely fitted.

2. Slide one labyrinth seal, consisting of labyrinth flinger and a V-ring. Note: Make sure seal lip of V-ring is away from flinger. Point prongs of flinger and V-ring towards bearing location. Slide labyrinth insert with O-ring installed on its O.D., in this order, on the shaft.

3. The bearing is mounted on the shaft (directly or on an adapter) and filled with grease.

4. The second labyrinth seal is placed on the shaft following instruction as described above under 2.

5. The shaft, complete with bearing assembly and labyrinth seal assemblies is placed in the lower half of the housing.

6. For held unit, fixing rings are placed in position. For free unit, bearing must be located in center of bearing seat of housing for proper lubrication.

7. The housing base is checked for alignment, ensuring that is within acceptable limits, and the mounting bolts are then slightly tightened.

8. At the first charge of grease, the bearing MUST be filled with grease. See page 40. (do not wash out the protective coating) the housing will be filled one-third full.

9. The housing cap is fitted, being careful not to damage the O-rings on the O.D. of the seal inserts, and the cap bolts tightened to the recommended torque, see Pages 26 through 37. Note that the cap **must not be interchanged** with that of another housing.

10. The mounting bolts are tightened to the support.

11. To adjust labyrinth seal flingers, move the flingers axially toward housing till they contact insert. Back flinger off 1/16” (1.6 mm) on “HELD” assembly. For “FREE” assembly back off the amount of the expected shaft expansion plus 1/32” (0.8 mm). Tighten the set screws which secure the flingers on the shaft. To complete the assembly in the case of SDCD housings with these labyrinth seal assemblies, take one half of the 4 mm rubber cord supplied and insert it in the counter bore of each flinger bore adjacent to the outer face.

12. At the initial start up, with shaft rotating, lubricate seals through grease fitting until a bead of grease appears around the periphery of the flingers. NOTE: Use same grease as for lubrication of bearing.

LUBRICATION

General

It is necessary to lubricate rolling bearings to prevent metallic contact between rolling elements, raceways and cage.

The most favourable running (operating) conditions for a rolling bearing is obtained when the minimum quantity of lubricant necessary to ensure reliable operation is used.

However, the quantity used also depends on additional functions required of the lubricant, i.e. sealing and cooling.

Lubricating properties deteriorate as a result of aging and mechanical churning. When using labyrinth and taconite seals in severely contaminated environments, it is suggested to shorten the lubrication interval. Also certain operating conditions i.e. high speeds, high temperatures or heavy loads require more frequent lubrication.

The choice of lubricants depends primarily on the temperature range, operating speed and magnitude of the load.

Either oil or grease of proper quality can be considered for lubricating bearings. At low and medium speeds, grease usually permits a simpler method of obtaining reliable and durable lubrication. It requires a simpler sealing system and has an additional advantage of affording excellent protection to bearings against rust and intrusion of contaminates. With high speeds, it becomes necessary to add fresh grease and remove old grease more frequently to obtain safe operation. At some limiting speed, grease must be replaced so often that it becomes impractical. Then oil should be used.

When oil is used, it is advisable to employ an oil reservoir or an adequate supply of oil and effective housing seals so that the oil does not leak out. The level of oil should be about the center of the lowest ball or roller when the bearing is stationary.

Too high an oil level or too large a quantity of grease, usually results in a high operating temperature due to churning of the lubricant.

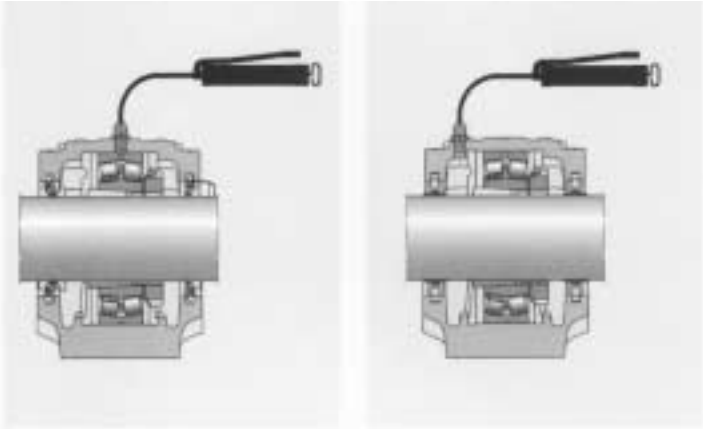
Grease Lubrication

SKF pillow block housings are primarily intended for grease lubrication. In the majority of cases it is sufficient to charge the housings with grease on mounting and to replace this grease periodically, either at specified time interval or when performing inspections.

Pillow block housings caps can be equipped with grease fittings. For spherical roller bearings with W33 or E suffix (groove in outer ring and three lubricating holes spaced at 120°) the center lubricating fitting must be used. For bearing without the E or W33 feature, either of the two side lubrication fitting are used to supply grease. Generally the side opposite the lock nut.

Lubrication through center fitting for W33

Non W33



If grease is used as a lubricant, at installation of bearing the lubricant must be worked in between the rolling elements. The housing should be packed 1/3 full. As a precaution, never mix greases with unlike base oils or incompatible thickeners. It should also be noted that bearings are generally lubricated after mounting. This ensures an accurate clearance measurement, avoids the mess in trying to handle a greasy bearing, and decreases the possibility of additional contamination being introduced into the bearing.

Only where, after mounting, an even distribution of grease in the bearing is not possible should one consider greasing prior to mounting.

Relubrication and Relubrication Intervals

Relubrication Intervals

The period during which a grease lubricated bearing will function satisfactorily without relubrication is dependent on the bearing type, size, operating conditions (load, speed, temperature, environment) and the grease used. The relubrication intervals (hours of operation) obtained from Diagram A are valid for bearings in stationary machines where loading conditions are normal. The diagram is based on the use of an age resistant, quality grease and is valid for bearing temperatures of +70°C. At temperatures over 70°C, the lubricating intervals should be halved for each 15°C rise, but the maximum permissible operating temperature for the grease should obviously not to be exceeded . Conversely, if operating temperatures are lower than 70°C, the intervals can be lengthened to about twice the 70°C values for operating temperatures of 50°C and below. It should be noted however that, relubrication intervals may vary significantly even where apparently similar greases are used.

Contaminated grease results in failures such as premature fatigue, polishing wear, etc. Where there is a risk of the grease becoming contaminated, the relubrication intervals should be reduced. This reduction also applies to applications where the grease is required to seal against moisture (e.g. bearings in paper making machines, where water runs over the bearing housings, relubrication should be done once a week).

The amount of grease

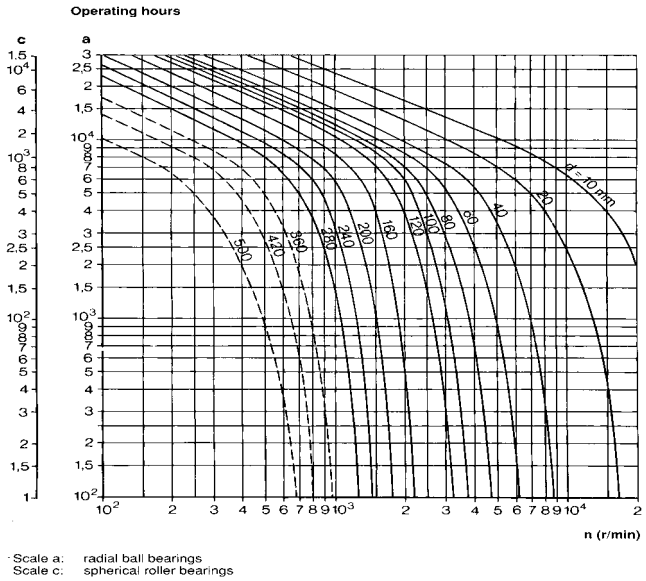
The amount of grease needed for relubrication can be estimated using the following formula:

G = 0,005 D B

where
G = grease quantity, g (for ozs, x 0.0353)
D = bearing outside diameter, mm
B = total bearing width, mm

If the relubrication interval is not specified we suggest at regular plant maintenance shutdown to remove and replace the lubricant. The cap of split housings and the cover of one-piece housing can usually be taken off to expose the bearing. After removing the used grease, fresh grease should be packed between the rolling elements.

If frequent relubrication is required a grease nipple should be fitted to the housing. A grease gun can then be used to ensure that fresh grease actually reaches the bearing and replaces the old grease. After a number of such relubrications, the housing should be opened and the used grease removed before fresh grease is added.



Scale a: radial ball bearings
Scale c: spherical roller bearings

Initial grease charges for split pillow blocks

The approximate intial grease charge (mass) for split pillow blocks is given in these tables. The recommended intial grease charge is one-third to one-half the volume of the free space in the pillow block, and the empty space between rolling elements and cage filled with grease (buttered). This recommendation is for moderate speeds and normal or light bearing loads (C/P>8.3).

AUTOMATIC LUBRICATION, WHERE YOU WANT IT, 24 HOURS A DAY, 7 DAYS A WEEK.

Any bearing deprived of correct lubrication will fail well within its predicted lifespan. With that fundamental engineering principle in mind, SKF, the world's largest bearing manufacturer, has introduced SKF SYSTEM 24, a new generation of automatic lubricators that bridge the conflicting interests of commercial need and environmental pressures.

Mounted in seconds, SKF SYSTEM 24 provides constant lubrication at a predetermined rate to minimize downtime and reduce the costs of expensive manual maintenance procedures.

A range of advanced lubrication products is available such as LAGD 125/WA2, a grease for general purposes, wide temperature applications (has EP additives); LAGD 125/LG202 grease and LAGD 125/HFP 120 oil, both non-toxic, non-staining, food compatible products.

Practical benefits

SKF SYSTEM 24 sets new standards in lubrication management and efficiency:

- **Reliability - allowing fit and forget procedures until predetermined replacement time.**
- **Transparent container to check lubricant levels**
- **High capacity, compact size permits installation in restricted areas.**
- **Dispense rate setting is a simple part of the installation process.**
- **Can be temporarily deactivated**
- **Reduced inventory cost as one lubricator covers all time settings.**
- **Hermetic sealing prevents ingress of dirt or foreign matter.**
- **No harmful chemicals to generate the drive gas.**
- **Lubricator time set dial allows easy and accurate adjustment of lubrication flow**
- **Transparent container allows visual checking of dispense rate**
- **Cartridge neck screws into lubrication point or accessories**
- **Special piston shape ensures optimum emptying of lubricator**

TECHNICAL DATA

Grease capacity	125 ml, (4.25fl oz. US)
Nominal emptying time	Adjustable; 1 - 12 months
Ambient temperature range	-20° to +55°C (-5° to +130°F)
Maximum operating pressure	4 bar (60 psi)
Drive mechanism	Gas cell producing hydrogen gas (H_2)
Connection thread	1/4" BSP
Recommended storage temperature	+20°C (+70°F)
Storage life of lubricator	2 years
Gas cell life	3 year
Weight	Approx 190g (6.7 oz) lubricant included

For additional Maintenance Products Tooling, Heaters and Lubricants contact you local SKF sales office or www.skf.ca

SKF Shaft Alignment Tool TMEA 1

Simplified alignment of rotating machinery

Approximately 50% of breakdowns in rotating machinery are caused by misalignment of the shafts. Poor machine alignment generates additional loads and vibration, causing premature damage to bearings, seals and couplings. It also significantly increases the energy consumption.

Using only four buttons and the well proven laser alignment techniques, the SKF Shaft Alignment Tool TMEA 1, makes accurate machine alignment operation simpler and quicker than with traditional methods and equipment. The TMEA 1 is supplied in a sturdy portable carrying case equipped with all the necessary accessories.

High accuracy but simple to operate

The TMEA 1 alignment tool uses two measuring units, both provided with a laser diode and a positioning detector. After attaching the measuring units to the shafts the on-screen instructions guide you simply through the alignment prcedure. The machine can then be correctly positioned according to the calculated live values provided on the display.

SKF precut machinery shims are a timesaving accessory to any rotating machine alignment job.

Good alignment means:

- **Reduced maintenance costs**
- **Longer bearing, seal and coupling life**
- **Less vibration and noise**
- **Less energy consumption**
- **Fewer unplanned stops**

User-friendly tool:

- **Only four buttons to operate**
- **Spirit levels integrated in the unit**
- **On-screen instructions**
- **Displays live results**
- **Easy attachment of measuring units**
- **Basic set of shims included**
- **Weight only 4,5 kg**
- **Sturdy portable carrying case**

For additional Maintenance Products Tooling, Heaters and Lubricants contact you local SKF sales office or www.skf.ca

SKF's Belt Alignment Tool TMEB1

Laser technology combines precise accuracy with simple operation

Accurate pulley alignment ensuring well-aligned belts is the key to Trouble-Free Operation of your belt driven equipment. BeltAlign, SKF's belt alignment tool, is the most precise alignment tool for V-belt pulleys available. Its advanced lightweight design coupled with cutting-edge technology makes it an ideal solution to enhance performance and reduce down time of your machinery. With only two components, BeltAlign is fast and easy to attach, and requires no training to operate.

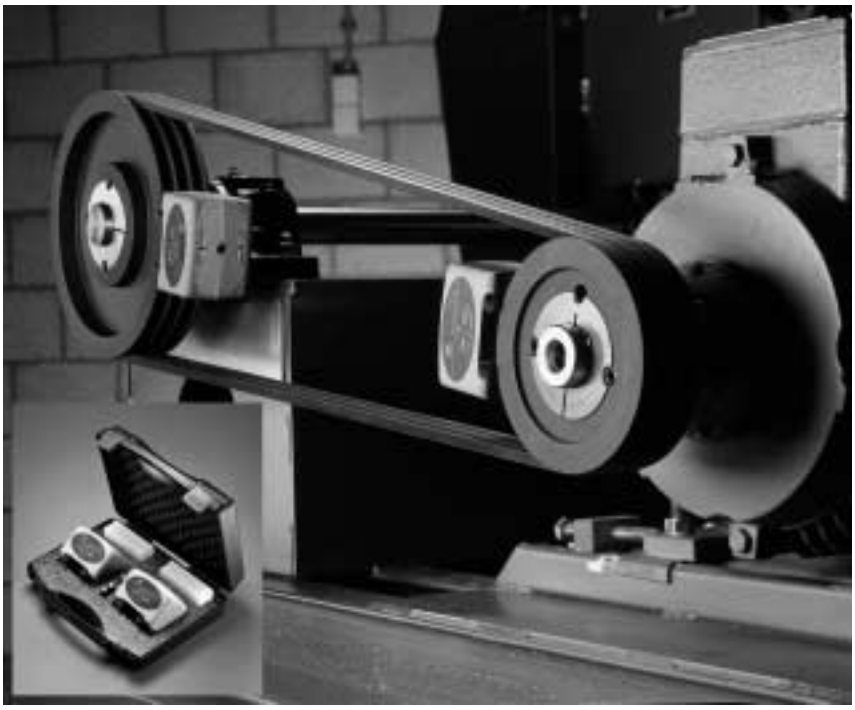
SKF BeltAlign attaches simply and securely to the pulley; two V-guides grip the groove while bar magnets hold the unit firmly in place.

Accurate alignment means:

- **Less wear on belt and pulley**
- **Less friction and therefore lower energy consumption**
- **Less vibration and noise**
- **Increased safety-prevents belt turnover in the pulley**
- **Increased up time**
- **Lower costs**

Advantages:

- **User-friendly tool**
- **Fast and easy to attach, easy to use**
- **Aligns grooves of the pulley rather than its face, allowing for alignment of pulleys of unequal width or with dissimilar faces even fits applications where pulley face cannot be used as a reference**
- **No trial and error. The laser position indicates the nature of misalignment allowing easy, accurate adjustment**
- **Facilitates simultaneous adjustment of tension and alignment**
- **V-guides allow for alignment of a wide range of V-belt pulleys**
- **The unique dual laser eliminates need for mirrors or reflectors, minimising diffusion of the beam over longer distances.**
- **Long (6 m) operating distance**
- **Only two components**
- **Lightweight**



For additional Maintenance Products Tooling, Heaters and Lubricants contact you local SKF sales office or www.skf.ca

TIH 015 Heater

Quality heater from SKF that does what heaters should do. And at a very competitive price!

SKF Bearing heaters are powerful, safe and have excellent long-term reliability.

SKF induction heater TIH 015 is made for heating bearings and other annular metal components up to approximately 40 lbs (20 kg), reaching a maximum temperature of approximately 600°F (300°C), depending on weight, geometry and material of the workpiece.

Induction heating

An induction heater is similar to a transformer, using the principle of a primary coil with a large number of windings and a secondary coil with a few windings on a mutual iron core. When heated by an SKF induction heater, the bearing becomes the short circuited, single turn secondary coil through which a high current flows at a low voltage, generating heat. The heater itself, as well as the yoke, remain at ambient temperature.

The SKF TIH 015 heater

The induction heater has a glass-fiber, reinforced housing in which a coil on a U-shaped iron core is mounted together with the START/STOP button. The heater is supplied with two top yokes suitable for bore diameters from 0.8 inch (20 mm) and 1.6 inch (40 mm). Every TIH 015 heater is provided with a 2 meter cable and a standard plug with a round grounding pin. Please note that the SKF TIH 015 is not equipped with automatic demagnetization, which instead must be done manually.

Safety feature

The TIH 015 is equipped with automatic overheating protection. With every heater, a free pair of heat resistant gloves is included.

This quality SKF heater comes with a 3 year warranty for long term reliability.

SKF New Puller Series: EasyPull TMMA

Safe and simple dismounting of bearings

Equipped with spring operated arms and safety pin, SKF's new patent-pending EasyPull is one of the most user-friendly and safe tools on the market today. Ergonomically designed, the spring-operated arms enable the user to position the puller behind the component with just one movement of the hand. Costs resulting from exchange of expensive spare parts are avoided with the EasyPull's unique safety pin which breaks instead of the pull itself, should excessive force be used. Additionally, hazardous slipping of the puller claws is avoided due to the special locking mechanism which ensures a tighter grip of the components as the pulling force increases.

EasyPull dismounts the most difficult bearings

Dismounting a bearing can be a demanding task for both user and puller. The new EasyPull, with its uniquely designed opening mechanism and safety pin, makes dismounting easy. Simply open the arms of the EasyPull by pressing the red rings together, place the EasyPull behind the component with one movement of your hand and pull either manually or with one of SKF's hydraulic tools. It's as easy as that.

• User-friendly:

- **Extremely user-friendly due to spring operated and self-locking arms, gripping behind the component with just one movement of the hand**
- **Ergonomic red-rings**
- **Available in three sizes with a maximum withdrawal force of 3, 5 or 8 tonnes (30, 50 or 80kN), enabling easy selection**
- **Hydraulic force generators available for the 8 tonne (80kN) EasyPull**
- **Light-weight**

• Safe:

- **Safety pin minimises any injury to the user and prevents damage to puller arms, rings and spindle**
- **Self-locking: Arms prevent risk of slipping of puller under load**

• Cost-saving:

- **No need to buy expensive spare-parts; a unique safety pin breaks should excessive force be used**
- **Service life of puller extended by safety pin**
- **Self-centering avoids damage to shaft**
- **Efficient use of time due to quick dismounting**

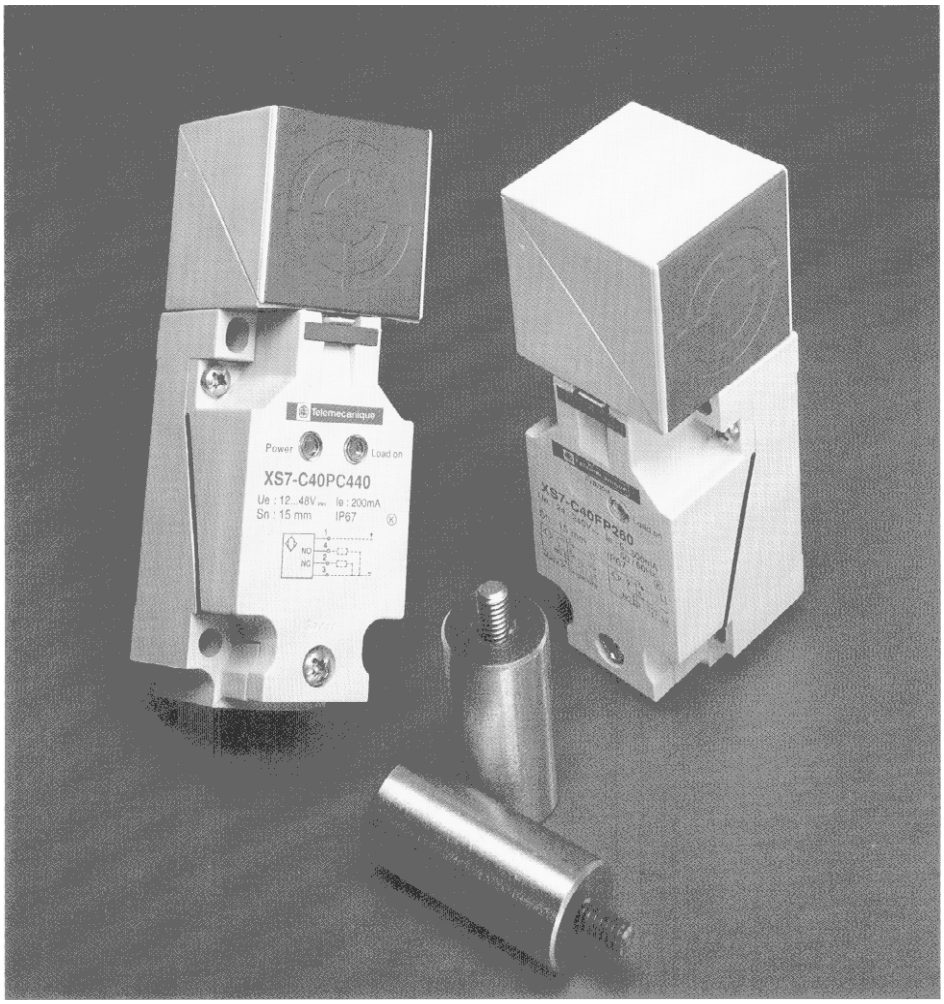
XS7, XS8
Plastic Plug-in Limit Switch Style



The XS7/XS8 Limit Switch Style Proximity Sensor offers maximum flexibility and outstanding environmental protection with many universal features or just enough for the OEM.

- PBT plastic body with stainless steel screws for harsh environments, i.e. food processing
- Plug-in design for ease of replacement
- "Universal" 5 position turret head for reduced inventory
- Standard 1/2" NPT conduit entrance with many wiring and connecting options
- PLC compatible
- Led system on selected models indicates ON/OFF and POWER ON
- Available in a wide range of voltages
  - — 10-58 VDC two wire N.O. or N.C. selectable
  - — 10-58 VDC PNP N.O. and N.C. *or*
  - — NPN N.O. and N.C.
  - — 20-264 VAC two wire N.O. or N.C.
  - — selectable
  - — 10-38 VDC NPN N.O. or PNP N.0.
  - — 20-264 VAC N.O. or N.C. selectable
- Features:
  - — Radio frequency immunity (RFI) standard
  - — DC versions work with unfiltered power supply
  - — Noise and transient protection
  - — Reverse polarity protection (DC models)

XS7 and X38 sensors can be used in a wide variety of applications, including:

- –Machine Tool
- –Printing
- –Food Processing
- –Assembly
- –Packaging

IEC Type Industrial Control Relays; TeSys D-Line, K-Line, and SK-Line
Overview

Description

TeSys D-Line Relays

These 600 volt relays are approved for use around the world. TeSys D-Line relays are usually mounted on 35 mm DIN 3 track, but can also be mounted directly to a panel. The fixed contacts in these relays have a NEMA A600 and Q600 ratings, in addition to the standard IEC ratings, making them suitable for use in most any control circuit. Low consumption versions of this relay are available for use with low level DC signals from a computer or a PLC. Adder decks can be added to a basic five pole relay to make it up to an 11 pole relay. The serrated silver-nickel contacts with wiping action provide excellent reliability in 12 or 24 volt control circuits. Special auxiliary contacts are available for switching low power down to 5 volts at 10 mA. Timer and mechanical latch attachments are available.

For more information on these relays, see pages 3 through 12.

K-Line Relays

These 600 volt relays are approved for use around the world. K-Line relays are usually mounted on 35mm DIN 3 track, but can also be mounted directly to a panel. One version of this relay can be printed circuit board mounted. A low power consumption version of this relay is available for use with low level DC signals from a computer or a PLC. The fixed contacts in these relays have a NEMA A600 and Q600 ratings, in addition to the standard IEC ratings, making them suitable for use in most any control circuit. Adder decks can be added to a basic four pole relay to make it up to a 8 pole relay. The serrated silver-nickel contacts with wiping action provide excellent reliability in 12 or 24 volt control circuits. An electronic timer attachment is available for this relay.

For more information on these relays, see pages 13 through 18.

SK-Line Relays

This two pole relay is the smallest IEC Type relay on the market. It is approved for use around the world. SK-Line relays are usually mounted on 35mm DIN 3 track. The fixed contacts in this relay have a NEMA A600 rating and a limited DC rating, in addition to the standard IEC ratings, making it suitable for use in most any AC control circuit and some DC control circuits. An adder deck can be added to the basic two pole AC relay to make it a 4 pole relay.

For more information on these relays, see pages 19 and 20.

Common Coil Voltage Codes

ac 50/60 Hz Coil (for additional voltage code options see page 7).

Volts	12	24	48	120	208	240	277	480	600
Code	J7	B7	E7	G7	LE7	U7	W7	T7	X7

dc Coil (coils have built in suppression as standard)

Volts	12	24	36	48	60	72	110	125	220	250	440
Code	JD	BD	CD	ED	ND	SD	FD	GD	MD	UD	RD

dc Low Consumption Coil (coils have built in suppression as standard)

Volts	5	12	24	48	72
Code	AL	JL	BL	EL	SL

❖ Grounding terminal points (2 terminals jumpered together; see diagram on page 8).
✚ Auxiliary contact blocks with four contacts cannot be used on relays with low consumption coils.
▲ Add proper voltage code to end of catalog number.
■ Includes 1 N/O and 1 N/C overlapping contact.
✳ For ring terminal configuration add “6” before coil voltage suffix. For example CAD32B7 becomes CAD32**6**B7.

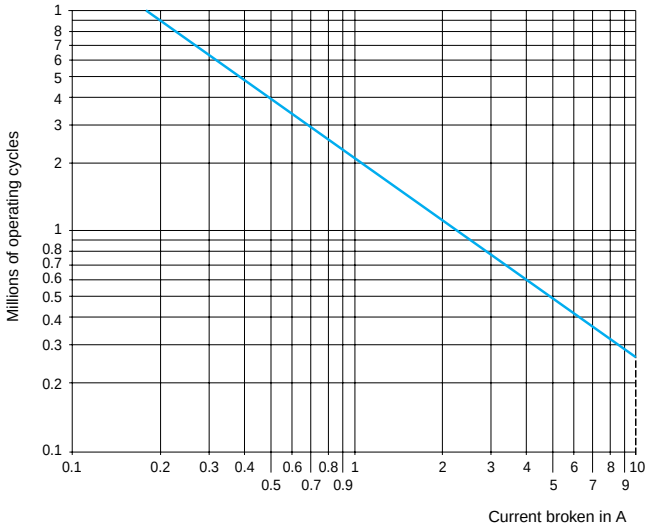
10 million operating cycles ♠	VA	4	8	20	40	70	80	100

DC Supply, Categories DC-13

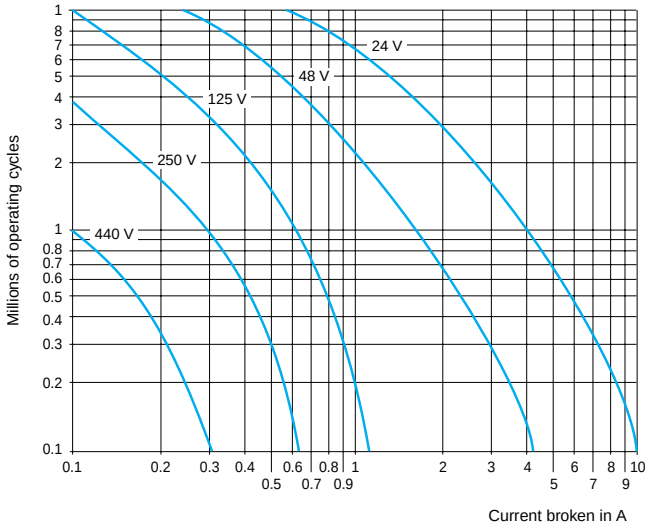
Electrical durability (up to 1200 operating cycles/hour) on an inductive load such as the coil of an electromagnet, without economy resistor, the time constant increasing with the power.

	V	24	48	125	250	440
1 million operating cycles ♠	W	120	90	75	68	61
3 million operating cycles ♠	W	70	50	38	33	28
10 million operating cycles ♠	W	25	18	14	12	10

Categories AC14 and AC15



Category DC13



Utilization Categories for Control Relays Conforming to IEC 60947-1-1

AC Applications		
	Category AC-14 (1)	This category applies to the switching of electromagnetic loads whose power drawn with the electromagnet closed is less than 72 VA. Application example: Switching the operating coil of contactors and relays.
	Category AC-15 (1)	This category applies to the switching of electromagnetic loads whose power drawn with the electromagnet closed is more than 72 VA. Application example: Switching the operating coil of contactors.
DC Applications		
	Category DC-13	This category applies to the switching of electromagnetic loads for which the time taken to reach 95% of the steady state current (T = 0.95) is equal to 6 times the power P drawn by the load (with P ≥ 50 W).

♠ The product life expressed above is based on average usage and normal operating conditions. Actual operating life will vary with conditions. The above statements are not intended to, nor shall they create any expressed or implied warranties as to product operation or life. For information on the listed warranty offered on this product, refer to the Square D terms and conditions of sale found in the Square D Digest.

Electronic Time Delay Attachment

- Relay output with common point changeover contact, 240 VAC or VDC, 2 A maximum.
- Control voltage: 85 to 110% Uc.
- Maximum switching capacity: 250 VA or 150 W.
- Operating temperature: 14 to 140°F (-10 to 60°C).
- Reset time: 1.5 s during the time delay period, 0.5 s after the time delay period.

Clip-on Front Mounting, 1 Block per Control Relay

Voltage	Type	Timing Range (s)	Contact Configuration	Catalog Number	Weight lb (kg)
24 to 48 Vac or Vdc	On-delay	1 to 30	1 N/O and 1 N/C with a common	**LA2KT2E**	0.09 (0.040)

Harmony

Looking good!

a brand of Schneider Electric

Telemecanique

Simply Smart!
Leveraging
ingenuity
and intelligence
for **ease of use**

Remote signalling
Harmony
An offer unmatched in content

The Telemecanique brand, worldwide leader in Operator Dialogue components, presents its **Harmony** remote signalling offer.
It enables you to receive, at distances from 5 to 100 m and throughout 360°, any light or audible signalling regarding the status of a machine.

Simple to select from, this offer comprising 3 ranges – Universal, Optimum & Application specific – provides a solution to meet your varying needs. Benefit from quick and simple installation, using either customer assembled variable composition products, comprising units that simply lock together, or complete, pre-assembled and pre-cabled products.

Ingenious, this offer is suitable for all types of environments.
The LED technology, used for all light signalling functions, ensures high performance and, with a view to environmental friendliness, optimises energy consumption.

Aesthetic, in perfect **synergy** with other Telemecanique equipment, Harmony remote signalling differentiates and ensures the efficiency of your dialogue solutions.

Universal range

High performance and wide choice of units

Perfect modularity

- This customer assembled variable composition range is suitable for all indoor and outdoor environments (up to IP66).

Speed and reliability of installation

- Fixing ensured by large locking ring (no tools required). It enables instant access to each unit as well as providing sufficient separation between colours.

Signalling from 35 to 50 m

- Improved performance provided by high luminosity LEDs, “flash” units (5 and 10 Joule) and a powerful, adjustable buzzer.

Optimum range

Excellent price / performance ratio

Economic

- Simple to use, this range, comprising pilot lights, beacons and complete (pre-assembled and pre-cabled) or customer assembled variable composition indicator banks, is for use in protected environments both indoors and outdoors (IP42).

Linear aesthetics

- A design both different and original, the smooth contours of the external surface avoid the accumulation of dust and grime.

Signalling from 5 to 35 m

- Transmission of light and sound signals optimised for short to medium distances.
- Use of LEDs, bulbs and flash.

Application specific range

Ready to use for your specific needs

- Rotating mirror beacons and sirens of pre-defined composition to complement your needs for very long distance signalling (up to 100 metres).
- Ready to use indicator banks: a selection of the most common solutions for repetitive applications.

Improved *performance* and more *innovation* for signalling to meet your needs

With Telemecanique, the inventor of the indicator bank, increase your productivity: remote visual and audible signalling enables the operator to attend to other tasks and, at the same time, be able to intervene quickly in the event of a problem regarding production.

Robustness

- For all indoor and outdoor applications.
- Good resistance to vibration and mechanical shock.
- Degree of protection up to IP66.

Simplicity

- Quick and simple installation using units that easily fit together or by selecting pre-assembled and pre-cabled products.
- Electrical connections between each unit made automatically whilst assembling.
- Units and light sources interchangeable without altering cabling.

Reliability

- "Protected LED" technology: protection assured against short-circuits, voltage spikes and electromagnetic interference.
- 100 000 hours luminosity without maintenance by using LEDs.

Safety

- The combined units are secured by either a screw or locking ring.
- Conformity to international standards and certifications:

Savings in costs

- LED technology for all levels of saving: low power consumption, reduced recycling.

Intuitive messages (conforming to standard IEC 60204-1)

Light signalling

- **Red:** urgent (immediate action required)
- **Yellow / Orange:** anomaly (checking and/or intervention required)
- **Green:** normal condition (optional)
- **Blue:** obligatory action (action required from the operator)
- **White:** monitoring (optional)

Flashing lights

For distinction or specific information:

- Attract more attention.
- Call for immediate action.
- Indicate discordance between the instruction and the actual status.
- Indicate a change in cycle (flashing during transition).

Flash and rotating mirror beacons

- A more powerful signal for top priority information or longer distance signalling (conforming to IEC 60073).

Buzzer and sirens

- Recommended in environments subject to considerable light or sound interference, or when the presence of the operator is of higher importance.

Universal range

High performance and wide choice of units

- **Signalling from 35 to 50 m**
- High degree of protection, up to **IP66**
- Perfect modularity: customer assembled, simple interchangeability of units
- Quick and safe installation: immediate assembly and fixing using locking ring (no tools required)
- Simple maintenance: instant access to each unit
- High luminosity: illuminated units with integral protected LED, base mounted protected LED, flash discharge tube (5 or 10 Joule)

All types of applications

Available in cream for clean environments

Assembly and instant locking of units by ring

Illuminated units with integral protected LED: only 1 ordering reference

The efficiency of Telemecanique branded *solutions*

Used in combination, Telemecanique products provide quality solutions, meeting all your Automation & Control applications requirements.

Harmony

is also a complete range of pushbuttons, switches and pilot lights, wall mounting control stations and enclosures, cam switches and foot switches, that are both simple to install and robust.

A worldwide presence

Constantly available worldwide

- More than 5000 points of sale in 130 countries.
- You can be sure to find the range of products that are right for your and which complies fully with the standards in the country where they are used.

Technical assistance wherever you are

- Our technicians are at your disposal to assist you in finding the optimum solution for your particular needs.
- Schneider Electric provides you with all necessary technical assistance, throughout the world.

▲ Other key numbers:
—key no. 421E: add the suffix 12 to the catalog number.
—key no. 458A: add the suffix 10 to the catalog number.
—key no. 520E: add the suffix 14 to the catalog number.
—key no. 3131A: add the suffix 20 to the catalog number.
Example:
The catalog number for a Ø 40 mm red mushroom head for a trigger action, maintained push button, with release by key no. 421E becomes: ZB4BS94412.

■ Trigger action mushroom heads are tamper proof in that a change of contact state is not possible by teasing or floating the operator.

(3) Adjustable throughout 360° in 5° steps.
(4) Special versions - 40°C or + 120°C available.

Metal, Fixed or Plug-in Body
General Characteristics

Environment

Conforming to standards	Products	IEC 947-5-1, IEC 337-1, EN 60 947-5-1, NF C 63-146, VDE 0660-200, UL 508, CSA C22-2 n° 14
	Machine assemblies	IEC 204-1, EN 60 204-1, NF C 79-130
Approvals		CSA A300, UL A300 Listed, NEMKO FI 10 (4) A-400 V, GL, BV, USSR A300=fixed, A600=plug-in
Protective treatment		Standard version : "TC". Special version : "TH"
Ambient air temperature		Operation : - 25...+ 70 °C. Storage : - 40...+ 70 °C Special sub-assemblies available for extreme operating temperatures (- 40°C or + 120 °C)
Vibration resistance		25 gn (10...500 Hz) conforming to IEC 68-2-6
Shock resistance		50 gn (11 ms) conforming to IEC 68-2-27
Electric shock resistance		Class I conforming to IEC 536 and NF C 20-030
Degree of protection		**IP 66 conforming to IEC 529 ; IP 667 conforming to NF C 20-010**
Repeat accuracy		0.01 mm on the tripping points
Cable entry		1/2" NPT

Contact block characteristics

Rated operational characteristics	**~ AC-15 ; A300 (Ue = 240 V, Ie = 3 A)** **⎓ DC-13 ; Q300 (Ue = 250 V, Ie = 0.27 A) conforming to IEC 947-5-1 Appendix A, EN 60 947-5-1**
Rated insulation voltage	Ui = 500 V degree of pollution 3 conforming to IEC 947-1 and VDE 0110, group C conforming to NF C 20-040 Ui = 300 V conforming to UL 508, CSA C22-2 n° 14
Rated impulse withstand voltage	U imp = 6 kV conforming to IEC 947-1, IEC 664
Positive operation (varies by model)	N/C contacts with positive opening operation conforming to IEC 947-5-1 Section 3, EN 60 947-5-1
Resistance across terminals	≤ 25 mΩ conforming to NF C 93-050 method A or IEC 255-7 category 3
Short-circuit protection	10 A cartridge fuse type gG (gl)
Cabling	Screw and captive cable clamp terminals. **XESP2151** and **XESP2141** : Clamping capacity, min. : 1 x 0.34 mm², max. : 2 x 1.5 mm² **XENP21●1** : Clamping capacity, min. : 1 x 0.5 mm², max. : 2 x 2.5 mm² **XCKJ plug-in and XESP20●1:** Clamping capacity, min. : 1 x 0.75 mm², max. : 2 x 1.5 mm²
Minimum actuation speed	**XESP2151, XCKJ plug-in, XESP20●1** : 0.001 m/minute, **XENP21●1** : 0.001 m/second

Electrical durability

Conforming to IEC 947-5-1 Appendix C.
Utilisation categories AC-15 and DC-13.
Maximum operating rate : 3600 operating cycles per hour.
Load factor : 0.5

7096

Features:

- Industrial grade magnet recommended for magnet actuated proximity sensors.
- Alnico is used as magnet material for all rigid models.
- Kevlar is used for the flexible magnetic tape.
- The rigid models are already mounted on several types of standard brackets for convenience (except the tubular “high power” version).
- Both South and North Poles are accessible and marked. **The South Pole version is the standard.** North Pole versions may be required in conjunction with the maintained magnetic switch (see page 308).
- For comparison an average magnetic strength rating is listed below. Measurements were made with a Gaussmeter at 0.13" from the sensing surface.

Description		Magnetic Strength	Catalog Number
Tubular		700 Gauss	**7046**
Flat bracket, center	South pole	330 Gauss	**7093**
	North pole	330 Gauss	**7547**
Flat bracket, side	South pole	240 Gauss	**7063**
	North pole	240 Gauss	**70631**
90° bracket	South pole	260 Gauss	**7062**
	North pole	260 Gauss	**70621**
Block type		340 Gauss	**7099**
Flexible tape	1' long	180 Gauss	**7096∗**

∗ For longer tape specify total length in feet. Example: 70966 = 6 feet.

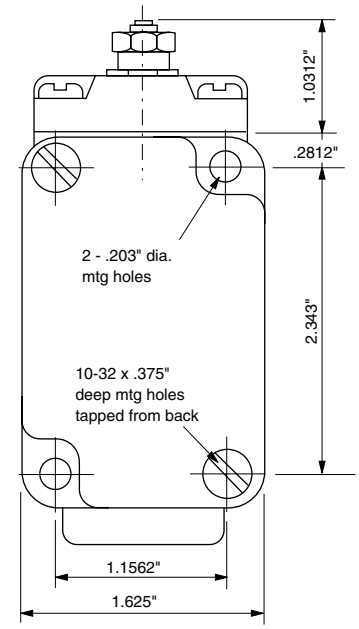
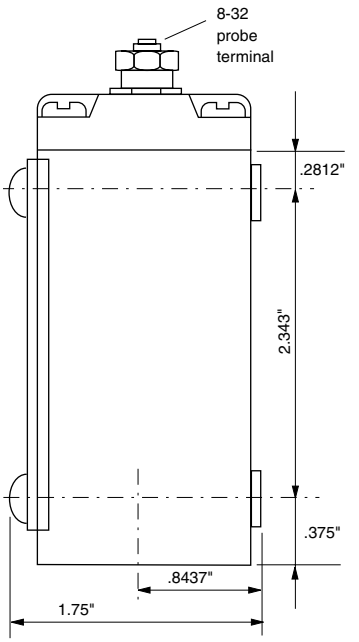
Proximity Sensors

10/02 © 1997-2002 Schneider Electric All Rights Reserved





The touch switch is a highly reliable AC solid state presence sensor designed for precise conductivity sensing. Applications include high temperature environment, light conductive, aggressive mechanical and chemical environments that targets positive end-point sensing. All models have a visible neon pilot light to indicate operation of the switch.

Features

- Housings - zinc die cast
- Solid state - no moving parts
- 115 Vac completely self-contained
- Probes up to 10 feet long
- High current output - no relay required for most applications
- Fast response - no warm-up time
- 0.5" NPT conduit entrance
- UL Recognized

Operation

The switch is actuated when a conductive path between probe terminal and ground (1 MΩ or less) is established. The electrical contact to ground operates the switching thyristor. Internal RC snubber and varistor provide effective protection from typical transients. Normal open models have a 10 millisecond (maximum) turn on time. Different off delay times are offered in order that the design engineer may compensate for relay chatter when the probe is subjected to “bounce” from irregular contact with the grounded metal point of contact.

NOTE: For isolated circuits where the ground is not common - the switch ground terminal should be connected to the neutral. The metal target to be detected by the probe should then be wired also to the neutral.

Probe characteristics

The probe terminal is an 8-32 stud protruding from the center of the head. Extensions may be any **electrically conductive wire** or material suitably **insulated from grounded** surface and **limited in length to 10** feet or less.

- Open voltage: 12 Vdc
- Peak current: 1 mA

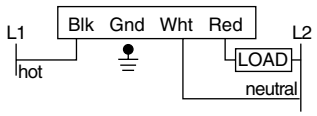
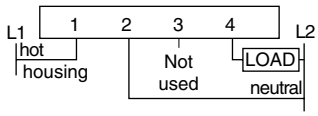
Wiring

Cable wiring



Target connected to ground

Terminal strip wiring



Target connected to ground
Housing must be grounded for proper operation.

Model ST switches may be wired in series or parallel. Connect red lead to black lead of other switch (terminal 4 to terminal 1 of other switch) for series operation. The voltage drop across each switch (in the closed state) does not exceed 2 volts AC.

Specifications

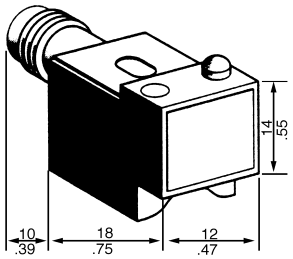
Cable



Nano style connector

Dual Dimensions $\frac{\text{inches}}{\text{mm}}$

Description

Detects the magnet installed on the piston through a non-ferrous cylinder wall. Universal mounting provided by clamp style and strap style mounting. Fast troubleshooting aided by output LED. Trouble-free operation insured by extensive protective circuitry. Connector versions.

Circuit type	Nominal Sensing Range ∗	Output mode	Load current maximum	Voltage maximum	Mating connector style	Catalog Number

NPN	3.5 mm	N.O.	100 mA	10-30 Vdc	1 thru 8	**XS7V12NA332S**

∗ At 11mT.

Application Information

The XS7V sensors detect the magnetic field generated by a magnet. The sensors are mounted in general on the cylinder. The magnets are mounted on the end of the piston and influence the sensor through a non- ferrous cylinder wall (i.e. aluminum). The sensors can be mounted anywhere along the cylinder using mounting accessories such as the ones shown on the next page.

© 1997-2002 Schneider Electric All Rights Reserved

Features:

- Shielded and non-shielded caps available
- Different versions available (beveled or non-beveled)
- Provides sensor face protection with no effect in operation

Description

Protection in harsh applications, helps to prevent abrasions, cracks, and other possible damage to the sensors face. Available in many different materials Ceramic, Delrin (Acetal), and Teflon. Provide your sensor with protection and a longer life without the additional charge of a stainless steel face option.

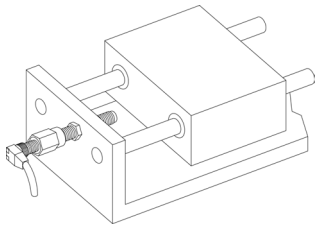
Proximity Sensors
Inductive Sensor Accessories
Plunger Screw Adapters



Features

- Accepts 8, 12, or 18mm shielded sensor
- Heat-treated alloy steel construction
- Rugged stop with solid state output

Description

Plunger Screw Adapters provide the ability for a shielded inductive proximity sensor to be used as a mechanical stop switch. Helps to solve many applications that require precise end of travel signals, or a hard stop. Spring requires 252g (9oz) to actuate sensor.

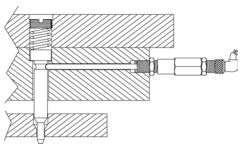
© 1997-2002 Schneider Electric All Rights Reserved



Features:

- Accepts any 8 or 12mm shielded sensor
- Accurate and compact switching in confined areas
- Large variety of stand probe lengths and diameters

Description

Proximity Probe is a spring loaded actuator designed to work with 8mm or 12mm cylindrical inductive proximity sensors. The probe and sensor combination offers increased flexibility in applications that require tight positioning.

Features:

- Quick change mounting available for 8,12,18 and 30mm sensors
- Short and Long barrel lengths available
- One time adjustment, makes sensor replacement easy and quick
- Provide protection to sensor from impact and damage
- Teflon caps available for quick change mounts (shown below)

Description

Provides time savings in maintenance of sensors, helps prevent downtime. An internal shoulder stop and a collet-style locknut precisely holds the sensor. This helps to maintain a precise sensing distance and reduces the required expertise needed during sensor installation.

Features:

- Accepts 8, 12, 18 & 30mm shielded or non-shielded sensors
- Sensors become unaffected by accidental impact
- Shielded and Non-shielded caps available, see page 313.

Description

Spring loaded sensor mount for tubular body styles provides impact protection for the sensor in the case of target over travel. The mount is designed to be threaded onto a tubular sensor and held in place by using one of the mounting nuts provided with the sensor. Caps are available to help protect the face of the sensor from lateral and axial impacts, see page 313.

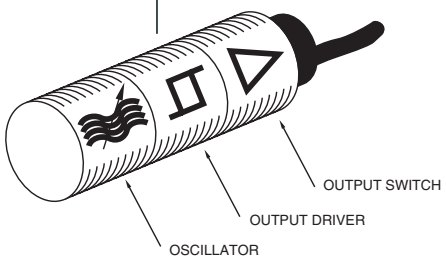
It is an important component in an automation control system.

It transmits information relating to the operating conditions of a machine to the logic processing system:

- Presence, passage, flow of parts
- End of travel
- Rotation and counting.

Essentially, it is a **non-contact part presence** detector.

Composition

Detection stage	Output stage
	


Detection stage • *type of mounting (cylindrical, rectangular)* • *detection characteristics (sensing distance, hysteresis)*	*Output stage* • *type of supply (DC, AC, AC/DC)* • *electrical characteristics (current and voltage)*

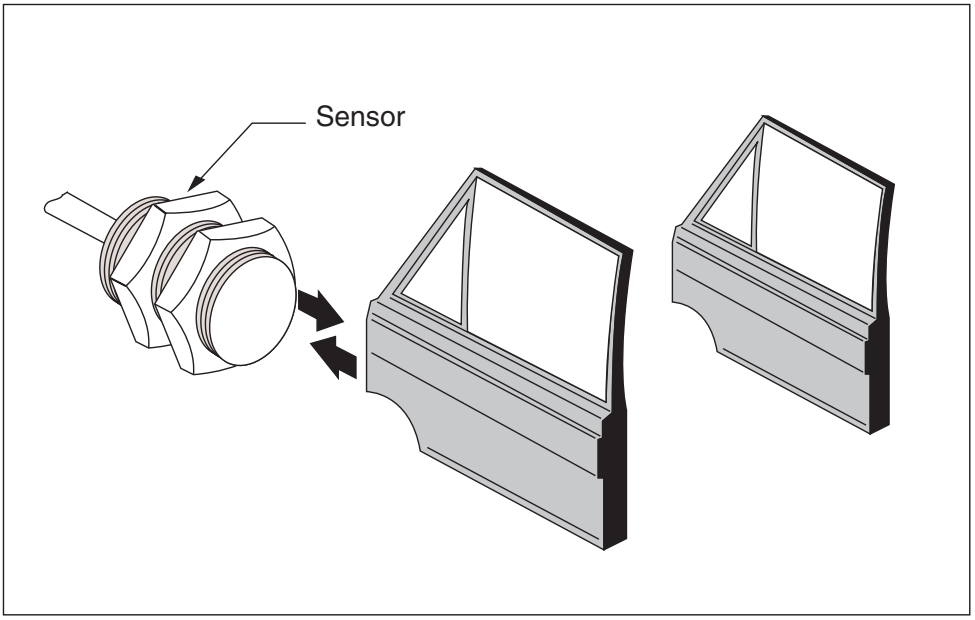
Application	Advantages
• *no physical contact with the target*	• *no wear, possibility of detecting fragile or freshly painted objects*
• *high operating rate*	• *perfect compatibility with electronic automated systems*
• *high approach speeds*	• *fast response*
• *rugged, fully encapsulated*	• *excellent resistance to industrial environments*
• *solid state, no moving parts*	• *life of the device is independent of the number of operations*

© 1997-2002 Schneider Electric All Rights Reserved

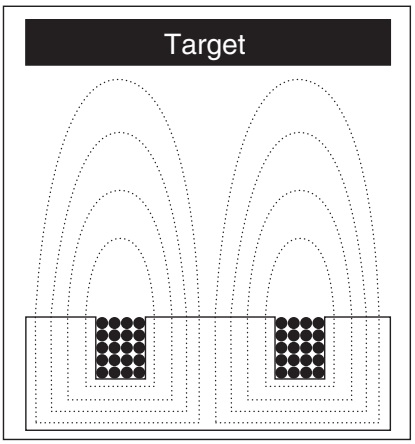
Suitable for the detection of metal objects

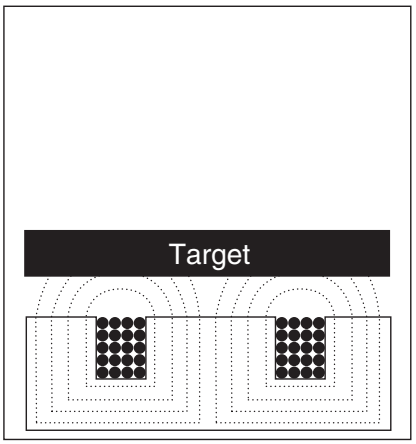
Inductive

- **Identifies** only **metal** targets
- **Predictable** sensing technology—few variables
- **Reliable** industrial technology



Principle of operation





An inductive proximity sensor is essentially comprised of an oscillator whose windings constitute the sensing face. An electromagnetic field is generated in front of these windings.

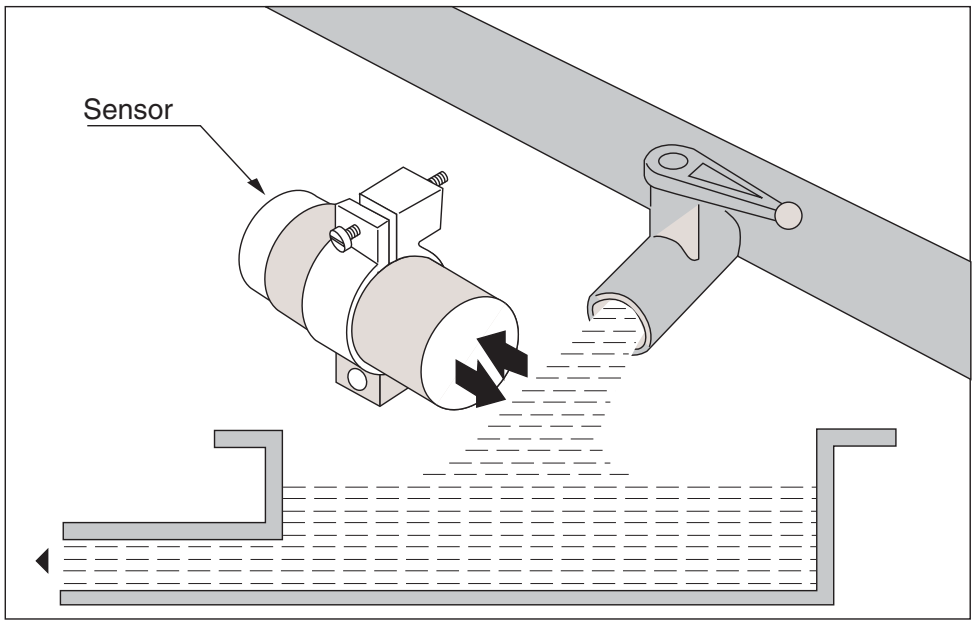
When a metal object is placed within this field, the resulting currents induced into the target form an additional load, and the oscillations cease.

This causes the output driver to operate, producing an ON or OFF output signal.

© 1997-2002 Schneider Electric All Rights Reserved

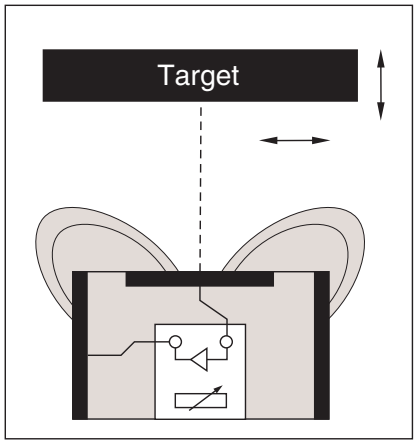
Capacitive

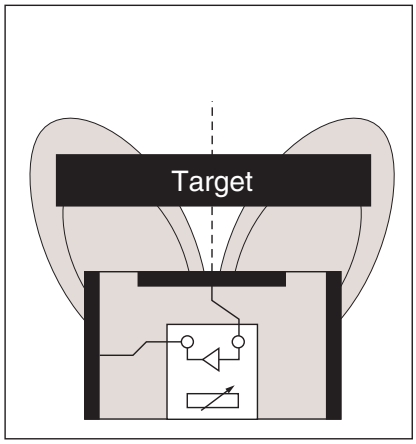
Suitable for the detection of non-conductive targets, liquids and powders



- Detects **any material**
- Affected by environment: humidity, dust, etc.
- Best for:
  - — bulk material
  - — liquids
  - — targets behind a separation wall

Principle of operation





An capacitive proximity sensor is basically comprised of an oscillator whose capacitors constitute the sensing face.

When a conducting or insulating material with a permittivity greater than air is placed within this field, it modifies the coupling capacitance and causes oscillations.

This actuates the output driver, and, depending on the model, an ON or OFF output signal is produced.

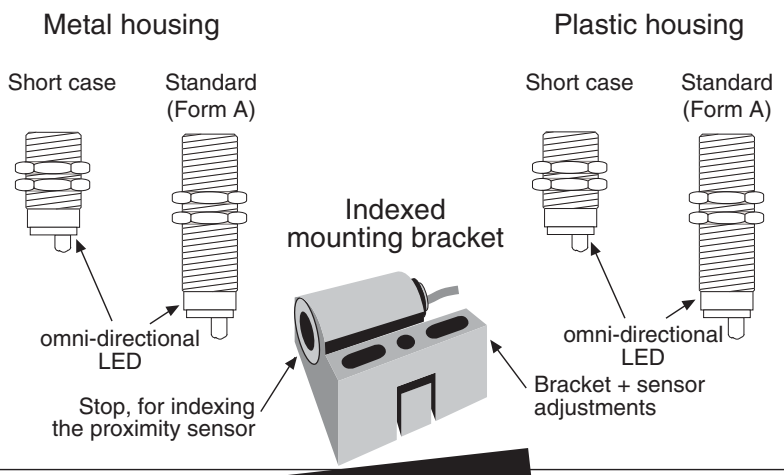
Housing types

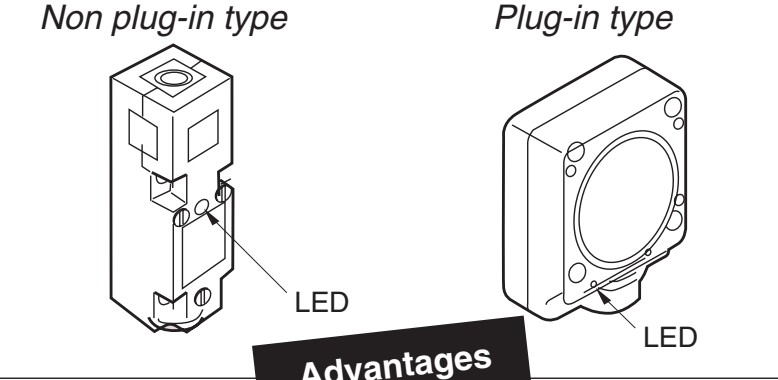
Tubular type



Advantages

- Simple installation and set-up: pre-wired or connector models
- Excellent environmental protection:
  - encapsulated
  - metal housing (plated brass)
  - plastic or stainless steel housing (food, pharmaceuticals)
- Two choices:
  - very short for restricted access areas
  - standard (form A) length for ease of replacement
- No adjustment replacement by using a patented indexing mounting bracket

Block type

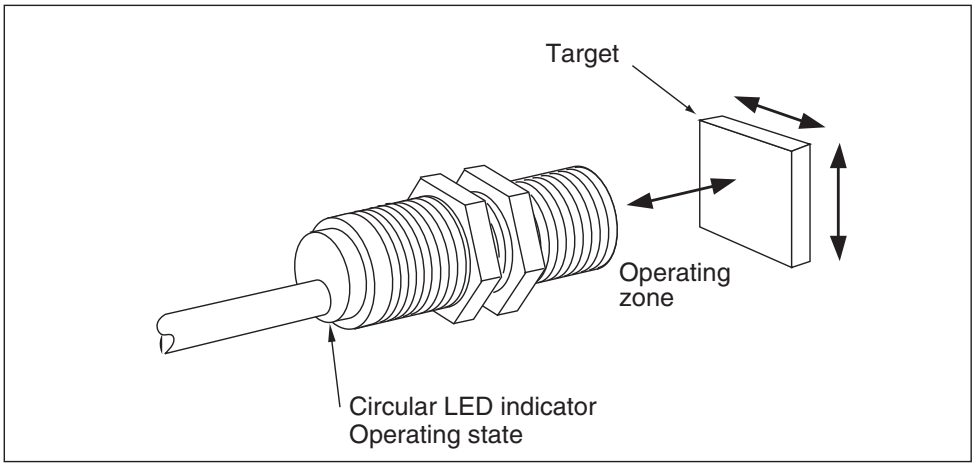


Advantages

- Direct interchangeability, no need for readjustment
- Flexibility of connections: screw terminals or connector
- Long sensing distance

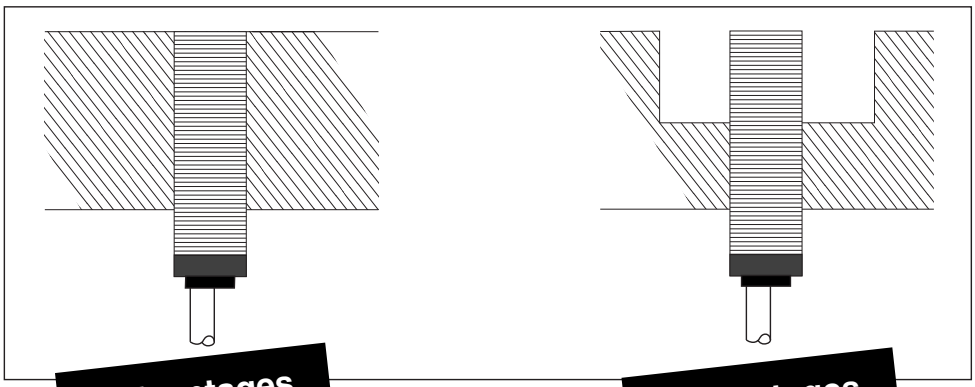
© 1997-2002 Schneider Electric All Rights Reserved

Operating zone



The targets are generally of steel, and of a size equivalent to the sensing face of the sensor. To ensure detection, the target should pass at a distance less than or equal to the usable sensing distance given in the data sheet of the sensor selected.

Suitabiliy for flush mounting in metal



Advantages

- No lateral effect

But

- Reduced sensing distance

Advantages

- Sensing distance + 50 to + 100%

But

- Space required around the device to eliminate the effects of the surrounding metal

© 1997-2002 Schneider Electric All Rights Reserved

Power supply

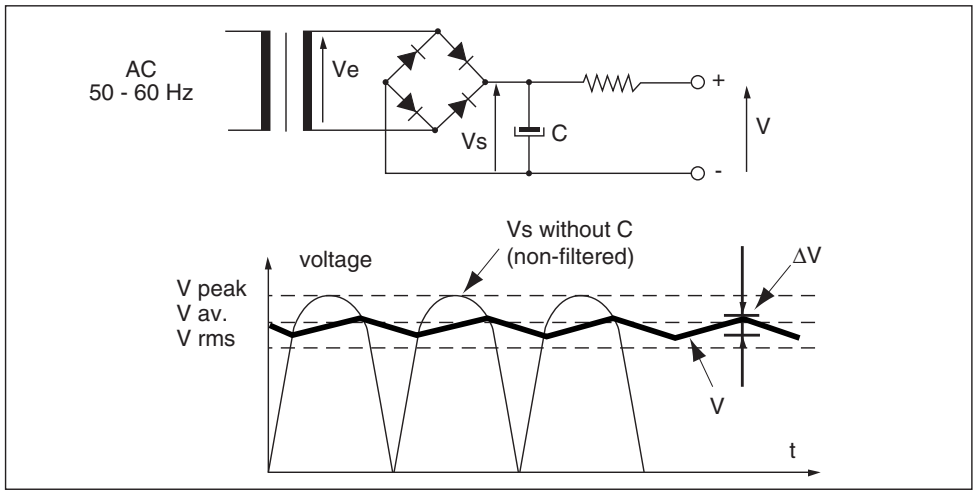
AC or AC/DC sensors for AC circuits

Check that the power supply range limits of the proximity sensor are compatible with the nominal voltage of the AC supply used.

Sensors for DC circuits

Where a DC supply is available, check that the voltage limits of the sensor, including ripple, are compatible with the supply used.

If an AC supply is available, a suitable DC power supply must be selected. A simple one has a transformer, a rectifier, and a smoothing capacitor.



Where voltage is derived from a single phase AC supply, it must be rectified and filtered to ensure that:

- **The peak voltage of the DC supply is lower than the maximum operating voltage of the sensor, peak voltage = rated voltage Ve x √2.**
- **The minimum voltage of the DC supply is greater than the minimum voltage rating of the sensor, given that ΔV = (I x t) ÷ C.**

  ΔV = maximum ripple: 10% (V)
  i = anticipated load current (mA)
  t = period of 1 cycle (8.8 m sec. full wave rectified 60 Hz frequency voltage)
  C = capacitance (μF)

As a general rule, use a transformer with a lower secondary voltage (Ue) than the required DC voltage (U).

Example: 18 Vac to obtain 24 Vdc
35 Vac to obtain 48 Vdc

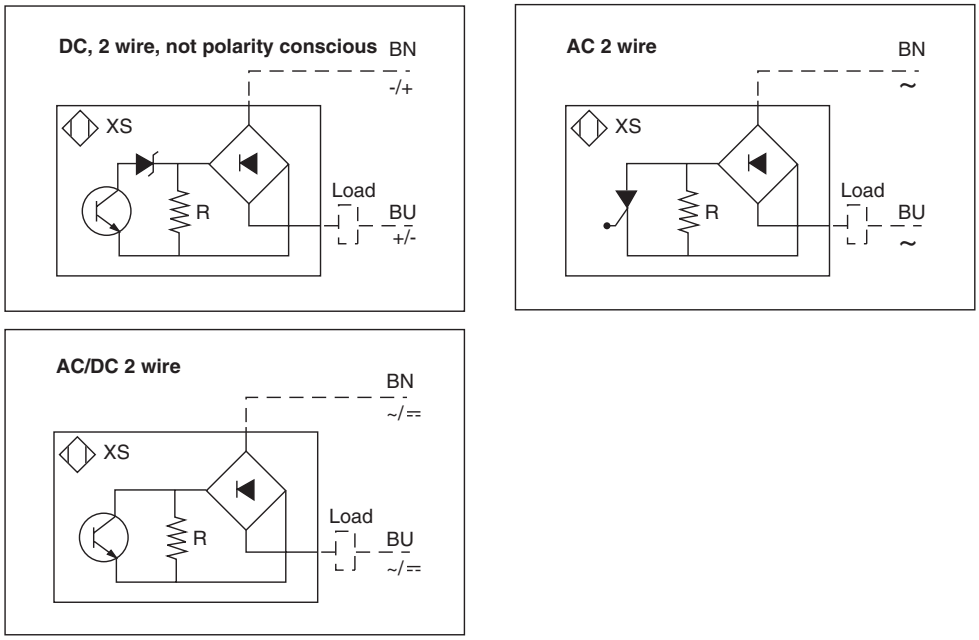
Mount a filtering capacitor of minimum 400 μF per sensor or 2000 μF for each ampere of load current required.

NOTE: Tubular 3 wire DC universal models (10-58 V), 3 wire DC XSF models, and all AC/DC models can be supplied from full-wave rectified non-filtered (no capacitor C in the diagram above) power supplies.

© 1997-2002 Schneider Electric All Rights Reserved

2 Wire type

Output signal



2 wire sensors are wired in series with the load to be switched.

They are subject to:

- a residual current (leakage current) - in the open state
- a voltage drop - in the closed state

For the AC and AC/DC versions, certain models are protected against short-circuits. Refer to the product characteristics.

Advantages

- *They can be wired in the same way as mechanical limit switches.*
- *For the DC and AC/DC versions, they can be connected to either positive (PNP) or negative (NPN) logic inputs.*
- *Polarity insensitive versions, no risk of incorrect connection.*
- *AC/DC versions, reduces stock requirements*

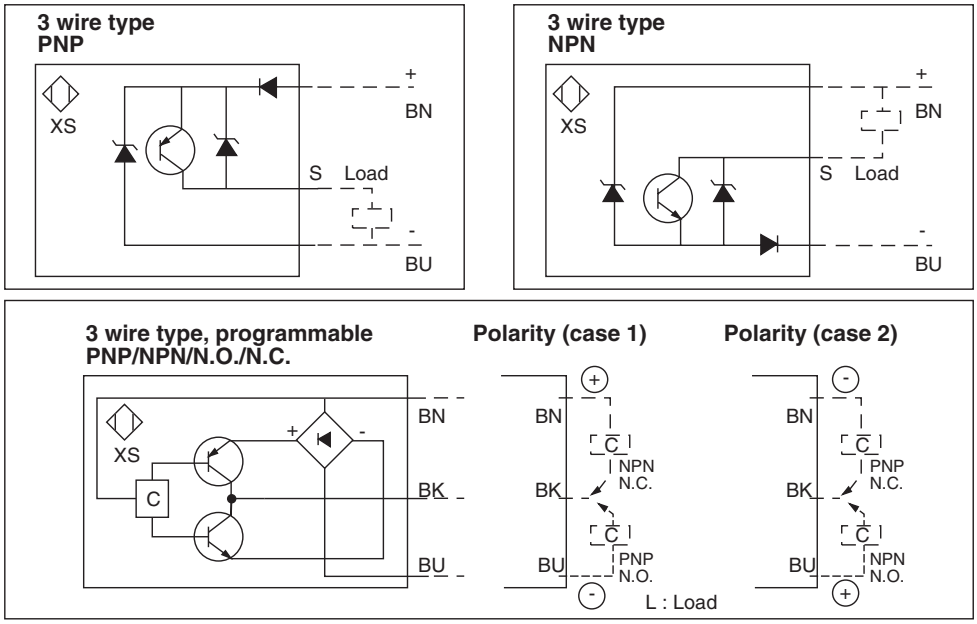
But

Check the possible effects of residual current and voltage drop on the input device controlled (pick-up and drop-out thresholds).

© 1997-2002 Schneider Electric All Rights Reserved

3 Wire type

Output signal



The sensors in this category have:

- 2 wires for the power supply
- 1 wire for the output signal

NOTE: Some models include an additional wire for a complementary output 4 wire type, N.O. + N.C. The technology is still 3 wires.

They are protected against reverse supply polarity and against overloads and short-circuit of the load. For the DC version, there are two types of sensor:

- Basic sensor
  - — PNP model, switching the positive side to the load (sourcing)
  - — NPN model, switching the negative side to the load (sinking)
- Universal DC sensors

A single universal sensor, depending on the wiring connections can perform any of the following 4 functions: PNP/N.O., PNP/N.C., NPN/N.O., NPN/N.C.

Advantages

- *Best switching characteristics: no residual current, low voltage drop, fast*
- *N.O. + N.C. versions*
- *Universal versions, reduces stock requirements*

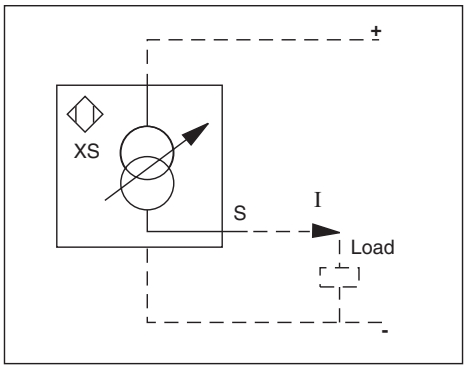
But

Requires the use of a specialized sensor (PNP or NPN, function of the load connection, to negative or positive, respectively) or a selectable universal type.

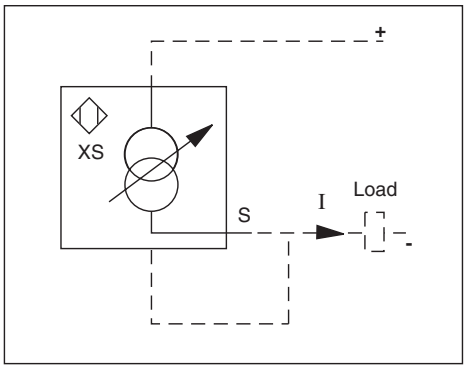
© 1997-2002 Schneider Electric All Rights Reserved

Analog type

Output signal



3 wire type



2 wire type

These proximity sensors convert the approach of a metal target towards the sensing face into a current output signal which is proportional to the distance between the target and the sensing face.

Two models:

dual voltage:	24/48 Vdc
Output:	0 - 10 mA with 3 wire connection
	4 - 14 mA with 2 wire connection
single voltage:	24 Vdc
Output:	0 - 16 mA with 3 wire connection
	4 - 20 mA with 2 wire connection

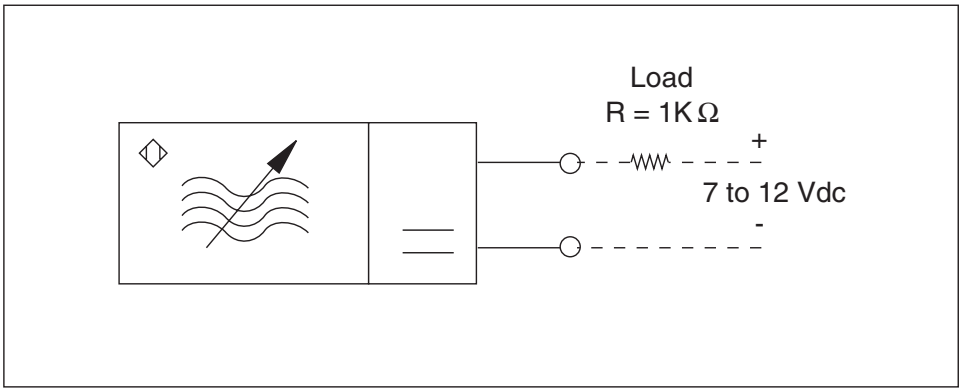
Advantages

- *Output signal proportional to the distance.*
- *Two or three wire connection using the same device.*

© 1997-2002 Schneider Electric All Rights Reserved

Namur type

Output signal



Namur type proximity sensors (DIN 19234) are electronic sensors in which the current consumption varies when a metal object approaches.

Their operating principle, together with their compact size, enables them to be used in a large number of applications:

- Intrinsically safe (hazardous environments, i.e. explosive). Sensors are used with NY2 intrinsically safe relay/amplifier or equivalent, approved intrinsically safe solid state input.
- Non-intrinsically safe (normal, safe zone). NAMUR sensors associated with a power supply and amplifier unit or equivalent solid state input.

Advantages

- *Can work in hazardous environments.*
- *Basic product, without amplifier.*
- *Compact size.*

Temperature Chemicals

Temperature: where sensors are used outside the ranges shown, reliable operation cannot be assured and permanent damage could result.

Standard length tubular sensors have a very large temperature range: -25° C to 80° C.

NOTE: For extended temperature range, consult factory.

Chemicals: due to the very wide range of chemicals which are found in modern industry, it is very difficult to give general guidelines on sensor applications.

To ensure lasting efficient operation, it is essential that the chemicals coming in contact with the sensors will not affect their housings and, in doing so, prevent their reliable operation.

The XS1/XS2 M series is particularly well adapted to the severe environment, such as machine tool applications.

NOTE: The cables used conform to standard NFC 32 206 and to recommendations CNOMO E03-40-150 N. They are UL Listed and CSA Certified.

The series XS4P plastic cylindrical proximity sensors as well as the stainless steel XS1/ XS2 sensors exhibit excellent overall resistance to:

- **Chemical products,** such as salts, halophytic and aromatic oils, petrols, acids, and diluted bases. For acids, ketones, and phenols, preliminary test should be made according to the nature and concentration of the liquid.
- **Agriculture and food industry products,** such as animal and vegetable based food products (vegetable oils, animal fat, fruit juice, dairy proteins, etc...).

NOTE: For specific details, please consult factory. Have the following information available when making the inquiry:

- *type of substance*
- *concentration*
- *maximum temperature*
- *specific sensor(s) part numbers considered for the application*

© 1997-2002 Schneider Electric All Rights Reserved

Shocks – Vibrations

Shocks

- The sensors are tested according to IEC 60068.2.27, 50g, duration 11 m sec.

Vibrations

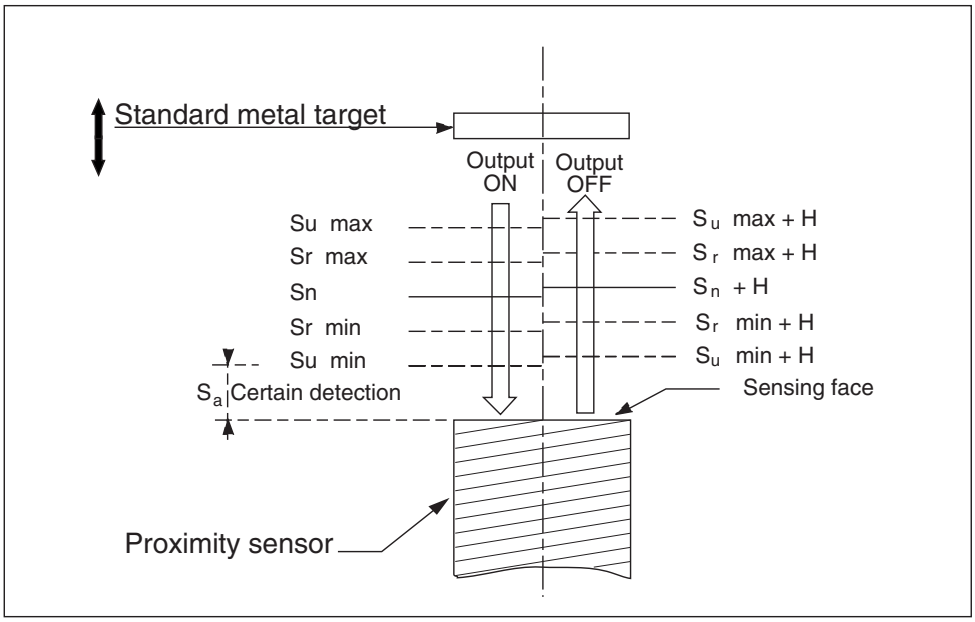
- The sensors are tested according to IEC 60068.2.6, amplitude ± 2 mm, F = 10-55 Hz, 25g to 55 Hz.

Degrees of protection

- IP67 - protection against the effects of immersion, tested according to IEC 60529. Sensor immersed for 30 minutes in 1 meter of water.
- UL Listed: typical NEMA 4X, 6P, 12. No deterioration in either operating or insulation characteristics.
- IP68 - protection against effects of prolonged immersion: the test conditions are subject to agreement between the manufacturer and user.
  Telemecanique selected machine tool applications or other machines frequently drenched in cutting fluids. **IP68 means,** in this case, **cutting oil proof**, a degree of protection requiring a superior encapsulation technology. Extensive testing is performed—1500 hours immersion in fluid at 70° C.

© 1997-2002 Schneider Electric All Rights Reserved

Definition of sensing distances



Nominal (or rated) sensing distance Sn:

The rated operating distance for which the sensor is designed. It does not take into account manufacturing tolerances, or any change in supply voltage, temperature, etc... during operation. Used for selection and base for exact calculations.

Real sensing distance Sr:

The real sensing distance is measured at rated voltage (Un) and at the rated ambient temperature (Tn). It must be between 90% and 110% of the real sensing distance: $0.9Sn \leq Sr \leq 1.1Sn$.

Usable sensing distance Su:

The usable sensing distance is measured at the limits of the permissible variations of the ambient temperature (Ta) and the supply voltage (Ub). It must be between 90% and 110% of the real sensing distance: $0.9Sr \leq Su \leq 1.1Sr$.

Operating zone Sa (usable sensing range):

The operating zone is between **0 and 81%** of the nominal sensing distance Sn:

$0 \leq Sa \leq 0.81Sn$

This is the operating zone of the sensor and corresponds to the area within which detection of the **standard metal target is certain** whatever the variations in voltage or temperature.

This is the **maximum** sensing distance **the designer should consider** for all applications. Correction factors should be considered only when conditions preclude the use of the standard target in the operating temperature and voltage range.

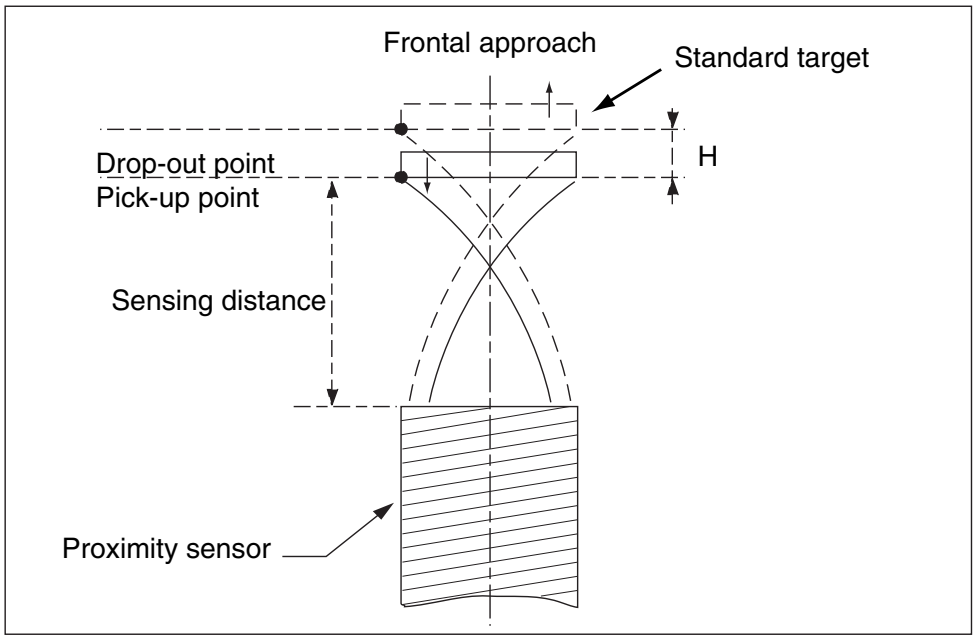
© 1997-2002 Schneider Electric All Rights Reserved

Standard metal target

Standard metal target:

1 mm thick, square mild cold rolled steel, type FE 360. The side of the square is either equal to the diameter of the sensor or of the circle engraved on the active face of the sensing face or is 3 times the nominal sensing distance (Sn). The higher of these values is used.

Differential travel



Differential travel: (hysteresis) H:

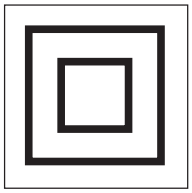
The distance between the pick-up point as the standard metal target frontally approaches the sensor, and the drop-out point as it moves away. Expressed as a percentage of the real sensing distance Sr.

Repeat accuracy (Repeatability

Repeat accuracy (repeatability) R:

The repeatability of the sensing distance, between successive operations. Readings are taken over a period of time while the sensor is subjected to environmental extremes, e.g. 8 hour cycle between 10 and 30° C, with supply voltage variation ± 5% of nominal. Expressed as a percentage of the real sensing distance Sr. Important parameter for positioning applications.

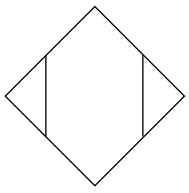
Class 2 material Double Isolation



Class 2 material - Double isolation

The symbol represents electrical insulation conforming to IEC 60536 class 2. It means that all live parts are isolated inside the housing and touching any exterior exposed metal is harmless. No groundings required.

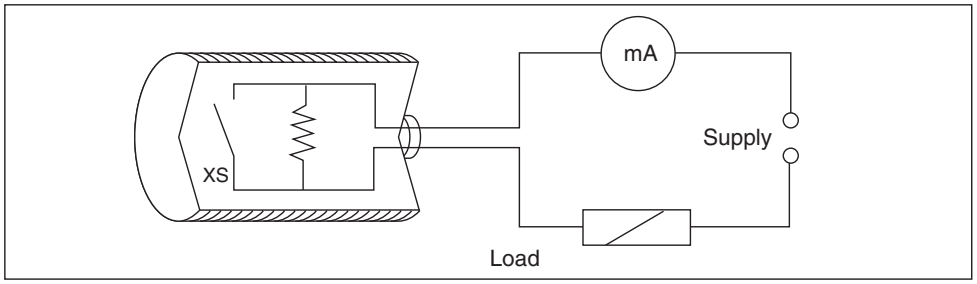
Symbol



International symbol for proximity switches.

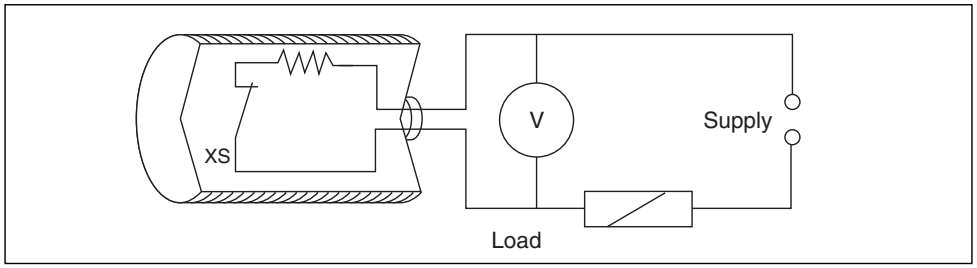
© 1997-2002 Schneider Electric All Rights Reserved

Leakage or Residual current (Ir)



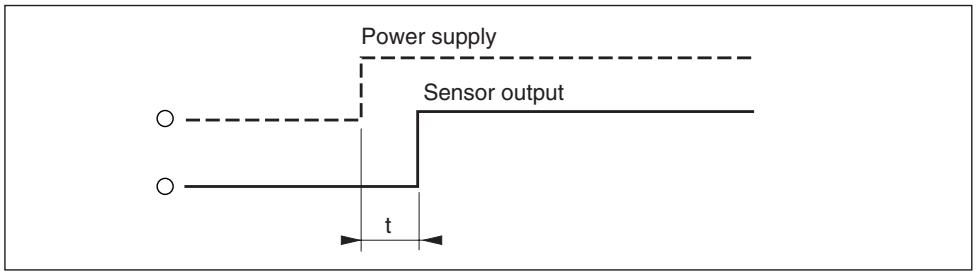
The leakage or residual current corresponds to the current flowing through the sensor in the OFF or “open” state. Important for 2 wire proximity sensors.

Voltage drop (Ud)



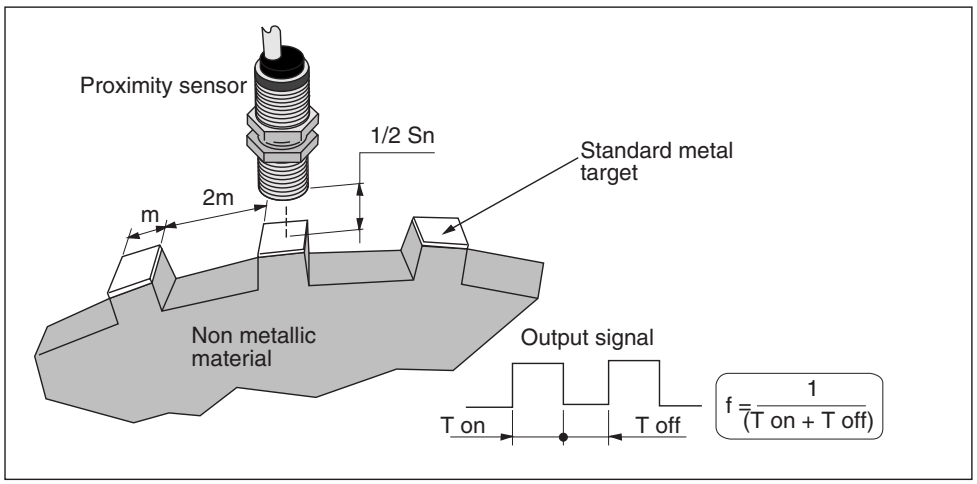
The voltage drop corresponds to the voltage at the proximity sensor’s terminals in the ON or “closed” state.Especially important for 2 wire proximity sensors.

RESPONSE TIME power-up delay



The period of time between energizing the sensor and its fully operational condition. Known also as “warm-up” or “first-up” delay.

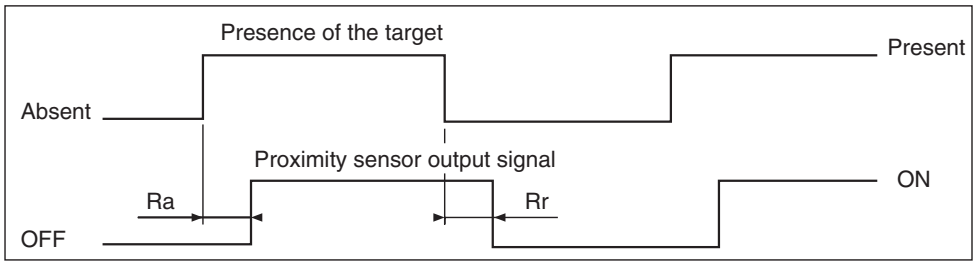
Maximum operating frequency



The maximum number of targets a proximity sensor can detect in a second, under standard test conditions (standard EN50018, IEC 60947.5.2). Do not use for selection or design purposes unless the geometry of the application is identical with the one in the picture.

© 1997-2002 Schneider Electric All Rights Reserved

Response time



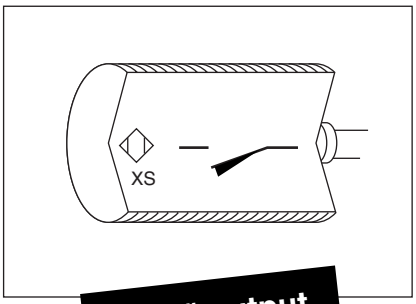
ON delay Ra:

The period between the detection of the target and the subsequent change in its output state. This design parameter determines the relationship between the speed of travel and the size of the target.

OFF delay Rr:

The period between the exit of the target from the sensor's operating zone and the subsequent change in its output state. This design parameter limits the interval between successive targets.

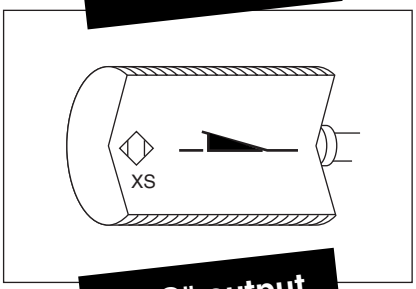
Output signal



"NO" output

N.O. - Normally open

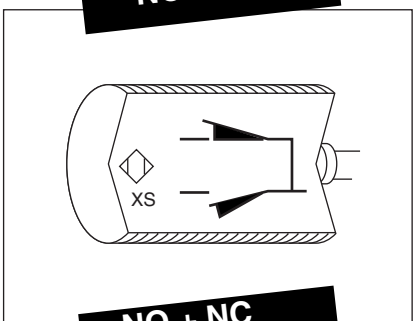
Output circuit turns ON output current when a target is present.



"NC" output

N.C. - Normally closed

Output circuit turns OFF output current when a target is present.



NO + NC output

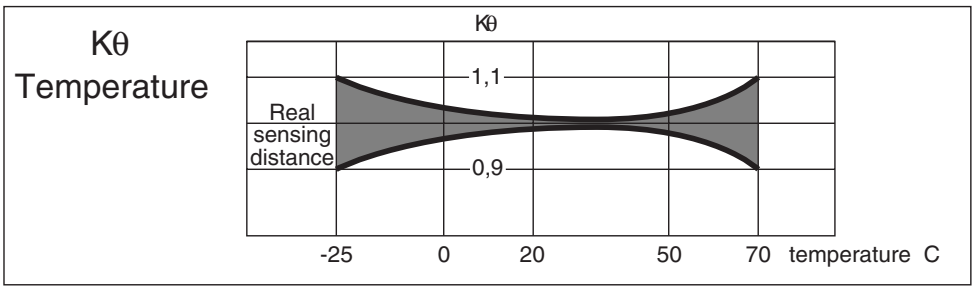
N.O. + N.C.

Complementary outputs proximity sensor with two outputs, one of which opens, the other closes when a target is present.

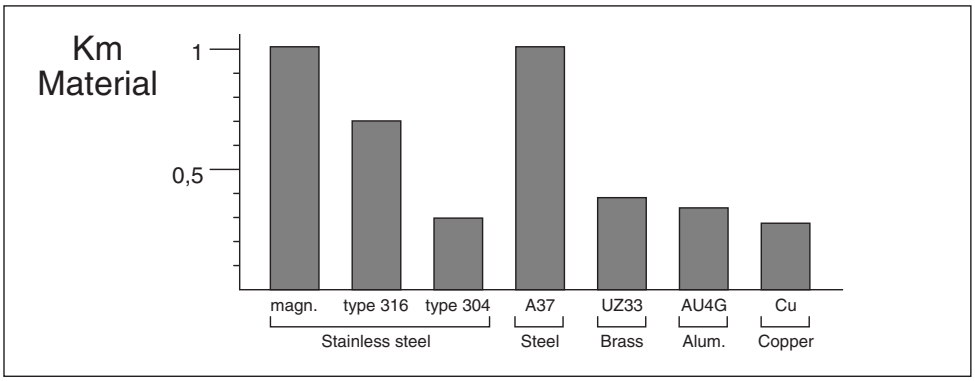
© 1997-2002 Schneider Electric All Rights Reserved

In practice, most targets are generally made of steel and are of a size, equal to or greater than the sensing face of the sensor. Where this is the case, use the sensing distance values given in the characteristics for the particular sensor. To calculate the precise sensing distance for specific applications, the following parameters, which affect the sensing distance, must be taken into account.

Theoretical calculation



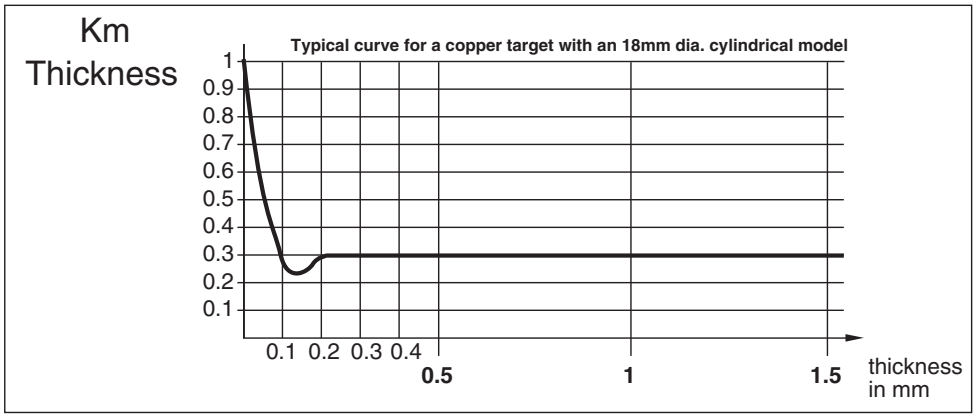
Apply a correction factor Kθ to be determined using the curve above.



Target material correction coefficient Km

Target Material	Stainless Steel			Mild Steel	Brass	Aluminum	Copper
	Magn.	Type 316	Type 304	A37	UZ33	AU4G	CU
Km	1.00	0.70	0.30	1.00	0.37	0.35	0.30

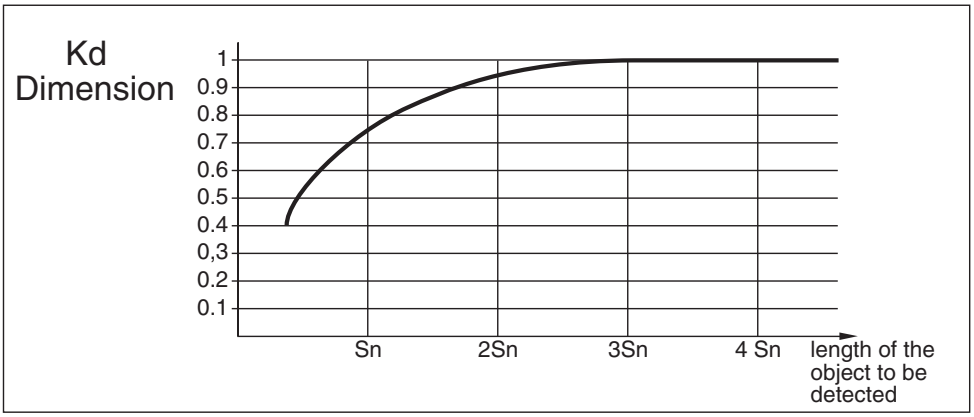
Apply a correction factor Km to be determined using the graph above.



Special case of a very thin target object made of non-ferrous material.

Application tip: Aluminum foil on a nonmetallic surface makes an excellent target.

© 1997-2002 Schneider Electric All Rights Reserved



Apply a correction factor Kd to be determined using the curve above.

Usable sensing distance

For all situations, use the general correction factor Kt = 0.9 for power supply variations within the entire voltage range.

Sa = Sn x KΘ x Km x Kd x Kt
Where Sa = usable sensing distance
Sn = nominal sensing distance

Calculation example

Proximity sensor XS7C40MP230 with nominal sensing distance Sn = 15 mm.
Ambient temperature variation 0° C to + 20° C.
Target characteristics:
material: Steel
dimensions: 45 mm x 45 mm x 1 mm

The operating zone, Sa can be found using the formula:
Sa = Sn x KΘ x Km x Kd x Kt
Sa = 15 x 0.98 x 1 x 0.95 x 0.9
Sa = 12.5 mm

Rule of thumb

For standard targets, the rule of thumb is:
Sa = 0.8 Sn

Always test!

Note

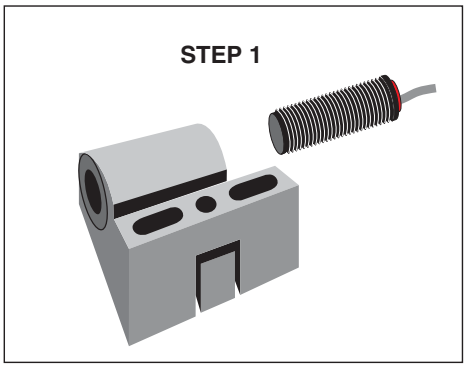
The above curves are typical curves only. They are given as a guide to the approximate usable sensing distance of a proximity sensor for a given application

© 1997-2002 Schneider Electric All Rights Reserved

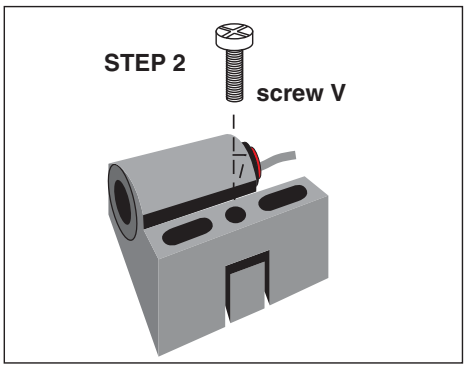
- Patented design
- No adjustment replacement

Mounting

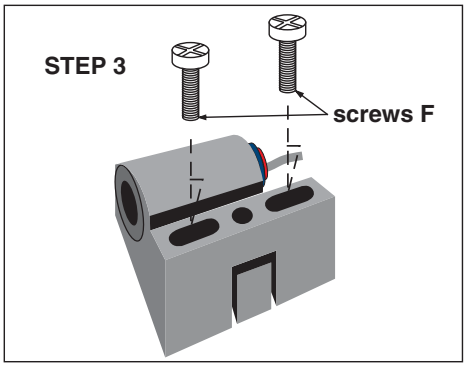
Indexed mounting bracket XSZB



- Insert the sensor in the bracket until it butts against the stop.



- Secure the sensor using V screw.



- Adjust the sensor/bracket combination to assure detection.
- Secure the combination using F screws.

If for any reason adjustment or replacement is necessary:

- Unscrew screw V
- Butt the new sensor against the stop. Once screw V has been tightened, the new sensor will be indexed in the same position as the old one. No adjustment is necessary.

Note: these functions are similar to those of a block type sensor

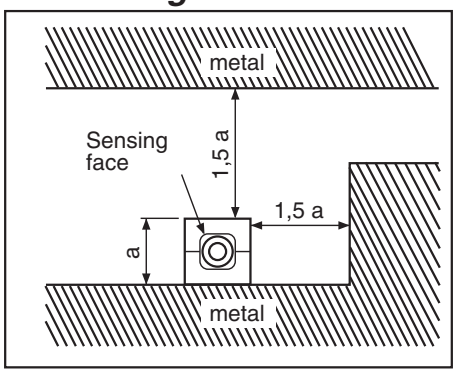
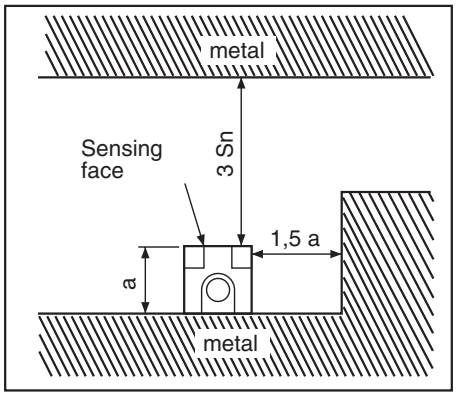
Block type proximity sensors not suitable for mounting in metal

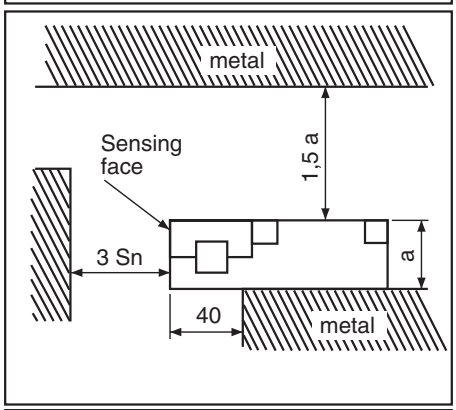
Non-shielded

Clearing distances

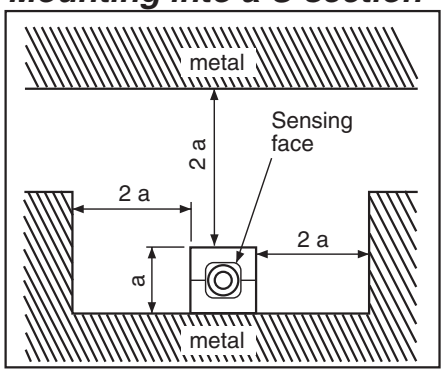
Mounting into a T section

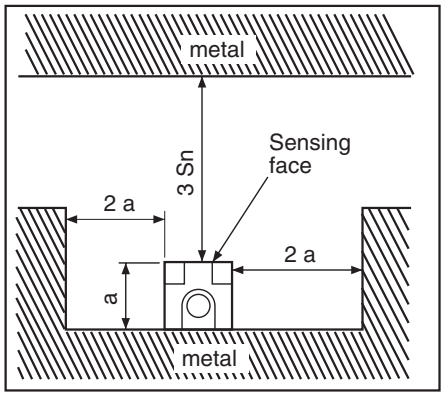


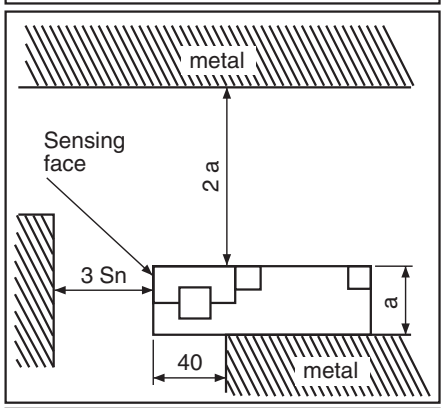




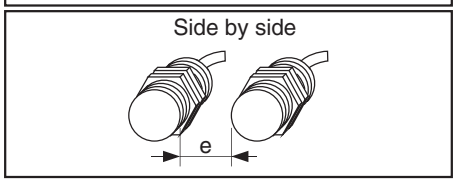
Mounting into a U section

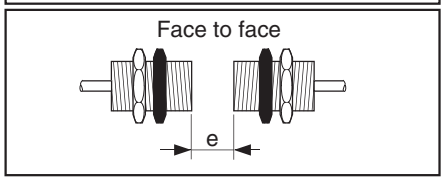






Side by side
Face to face



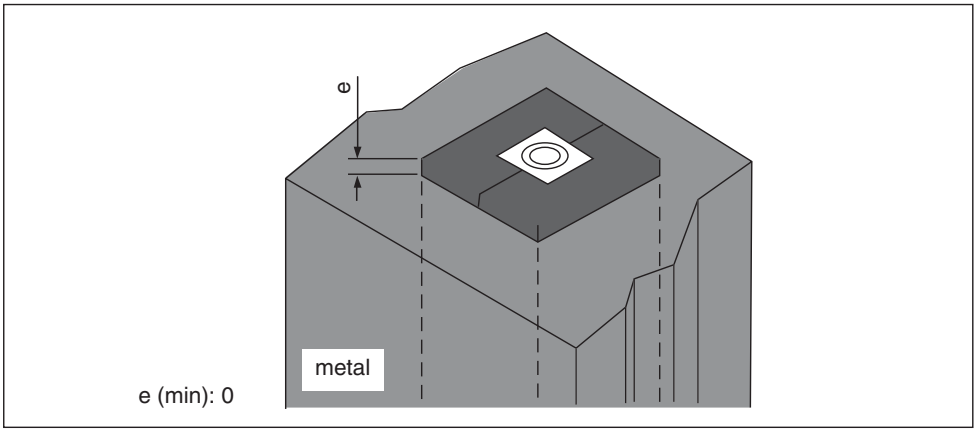


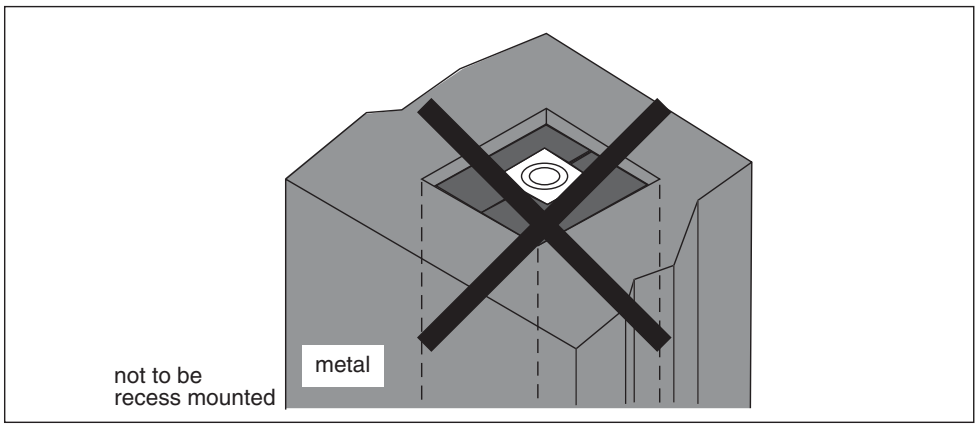
NOTE: For shorter distances, ***alternate frequency*** *models are required. Call factory for availability.*

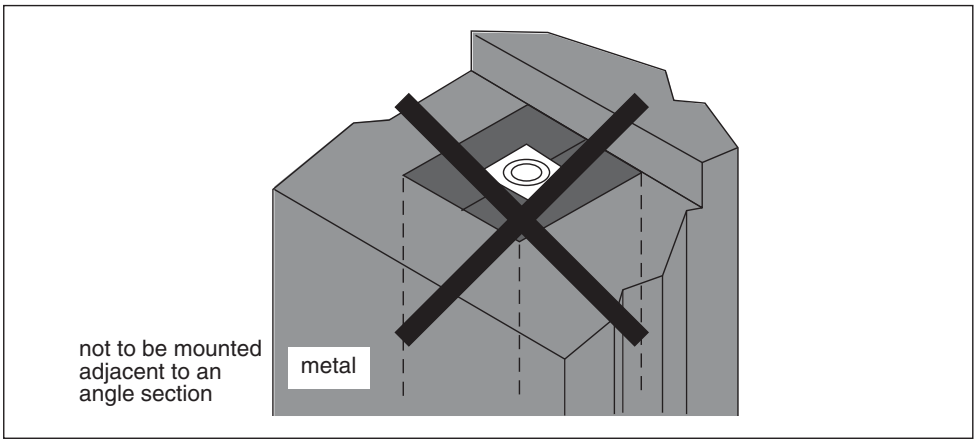
© 1997-2002 Schneider Electric All Rights Reserved

Suitable for flush mounting in metal

Shielded
Mounting with metal on one or more sides simultaneously





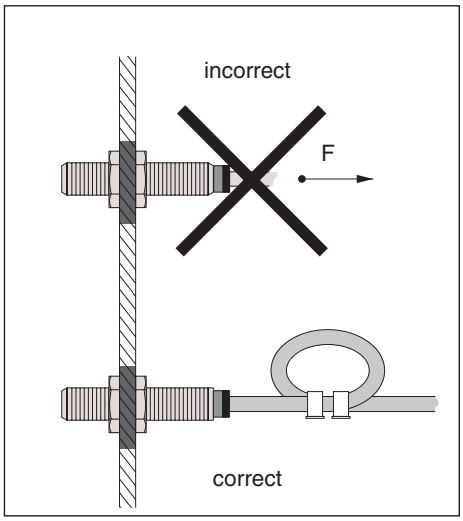


Any metal within the immediate vicinity of a proximity sensor distorts the magnetic field around the sensing face. The clearance distances shown above are given for a simplified installation arrangement and would result in the increase of the sensing distance of less than 5%.

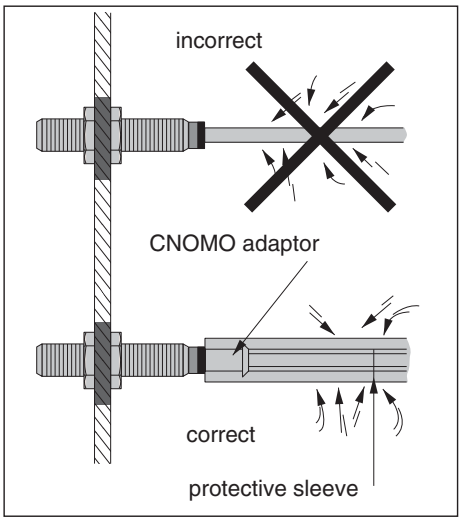
© 1997-2002 Schneider Electric All Rights Reserved

Precautions

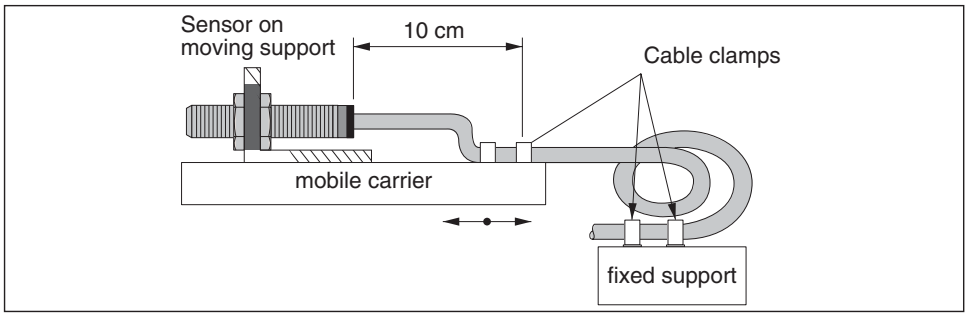
Protection of the cable



Do not exert a pulling force of over 4.4 lb on the sensor cable.

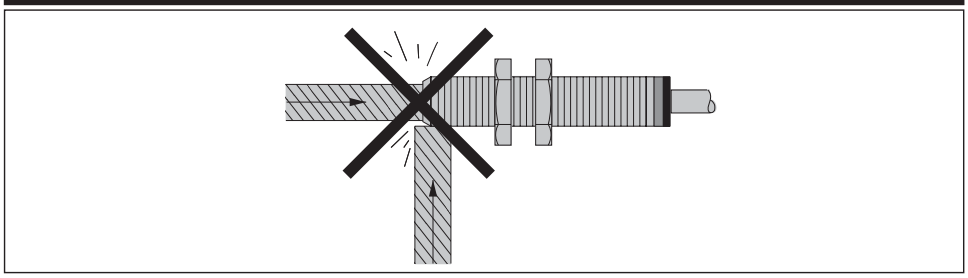


Consider using a protective sleeve or rigid conduit, where necessary.



Avoid repetitive flexing movement between the cable and the sensor.

Protection of the sensing face

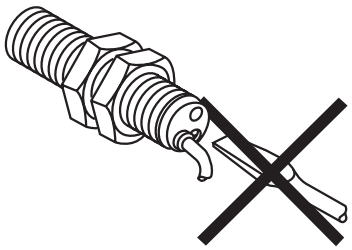


The sensor must never be used as a mechanical stop as this may cause irreparable damage.

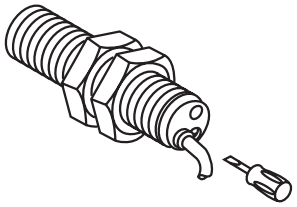
10/02

© 1997-2002 Schneider Electric All Rights Reserved

Use of tools for adjustment of the proximity sensor



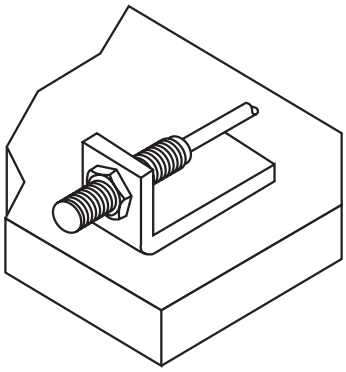
Incorrect



Correct

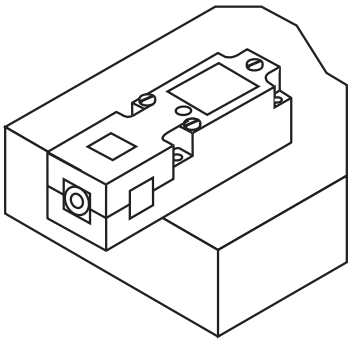
Mounting

Tubular sensor



Ensure a rigid mounting
the mounting must be sufficiently rigid and thick to resist shock and vibrations

Block type sensor

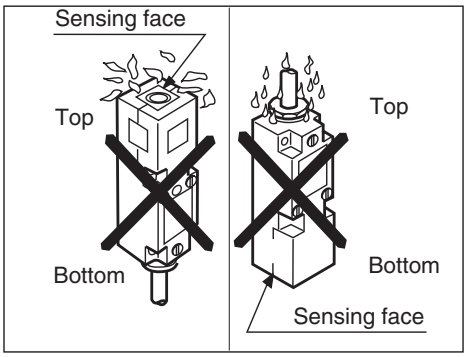


Ensure a rigid mounting
the mounting area must be large enough to support the sensor correctly

© 1997-2002 Schneider Electric All Rights Reserved

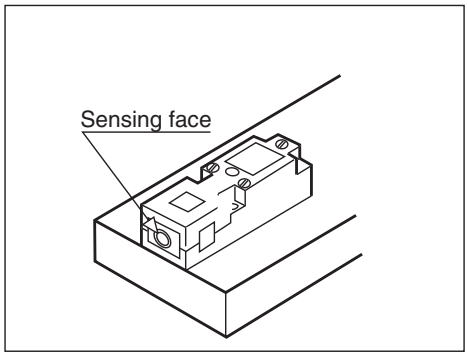
Precautions

Positioning



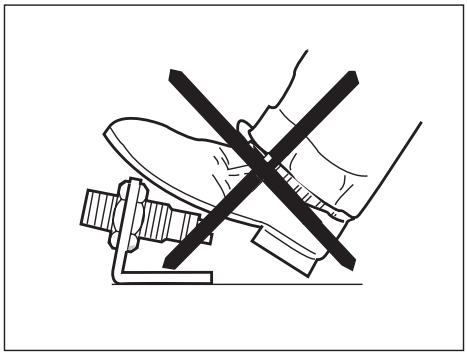
Incorrect

- *danger of debris collecting on the sensor sensing face*
- *danger of liquid entry should the cable gland be mounted improperly*

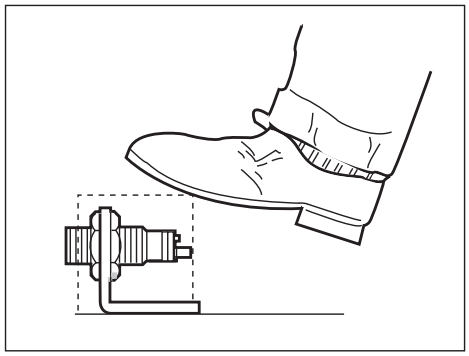


Correct

Mechanical protection



A proximity sensor should never be used as a footrest



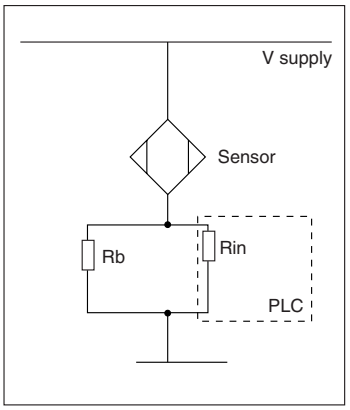
Where the possibility of this type of abuse exists, a protective cover should be fitted over the sensor

Remember: For proper installation, the sensor must be mounted solidly to its support.

Depending on the application, the adjustment of the operating distance is carried out:

- either by moving the mounting bracket
- or by adjusting the target

© 1997-2002 Schneider Electric All Rights Reserved



In order for a solid state, 2 wire, AC sensor to be directly compatible with a PLC, two conditions have to be met:

1. Leakage current: (I off) **less than 1.7 mA** (Off state)

2. Load current: greater than the sensor minimum load current (ON state). Typical PLC input currents (load current, I load) are 12-16 mA. Typical values for PLC input resistance (Rin) are: 7.5-10 kΩ.

For sensors which do not meet both of the requirements, a Bleeder Resistor (Rb) has to be wired in parallel with the load.

For each of the two situations, the Bleeder Resistor parameters have to be calculated as shown below. **The smaller value should be selected for the application.**

1. $Rb = \frac{Rin \times Vo\ Max}{I\ off\ (Rin) - Vo\ max}$ ✳ $Pb = \frac{Vs^2}{Rb}$

Where:
- Vo max = PLC input maximum OFF voltage (20-40 Vac)
- Rin = PLC input resistance
- Vs = Line voltage
- Pb = Minimum Bleeder Resistor power rating

Example:

I off = 3.5 mA
Vo max = 20 V
Rin = 6.5 kΩ

Typical examples for Telemecanique TSX DET input modules:

	TSX DET 1604	***TSX DET 0804***
For I off = 3.5 mA	*47 kΩ/0.5 W*	—
For I off = 7 mA	*4.7 kΩ/3 W*	*12 kΩ/1.5 W*

2. $Rb = \frac{Rin \times Vo\ Max}{I\ off\ (Rin) - Vo\ max}$ ✳ $Pb = \frac{Vs^2}{Rb}$

Example:

I min = 30 mA
Vs = 120 V
Rin = 7 kΩ

Typical examples using TSX programmable controllers:

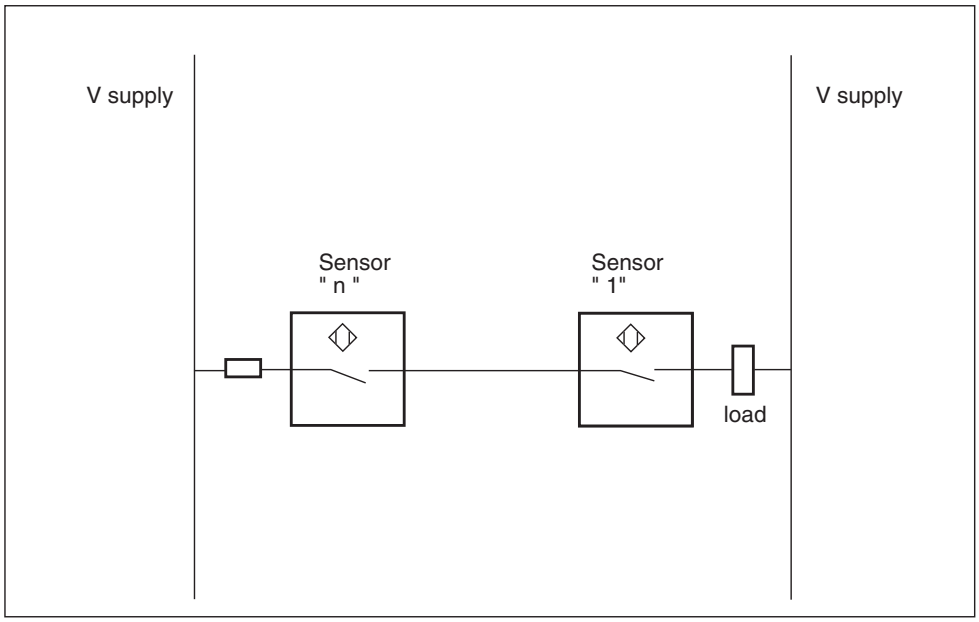
	TSX DET 1604	***TSX DET 0804***
For I min = 20 mA	*64 kΩ/0.5 W*	*24 kΩ/1 W*
For I min = 30 mA	*8.7 kΩ/2 W*	*8.7 kΩ/2 W*

NOTE: All DC 3 wire sensors are PLC compatible.

© 1997-2002 Schneider Electric All Rights Reserved

Wiring in series

Wiring two or more sensors in series 2 wire type



The following points should be considered:

1. When in the open state, each sensor will share the supply voltage:

   voltage across the sensor = $\frac{\text{V supply}}{\text{n° proximity sensors}}$

   V sensor and V supply must fall within the sensor's voltage range.

2. If a sensor is OFF, it will be supplied with nearly all the supply voltage.

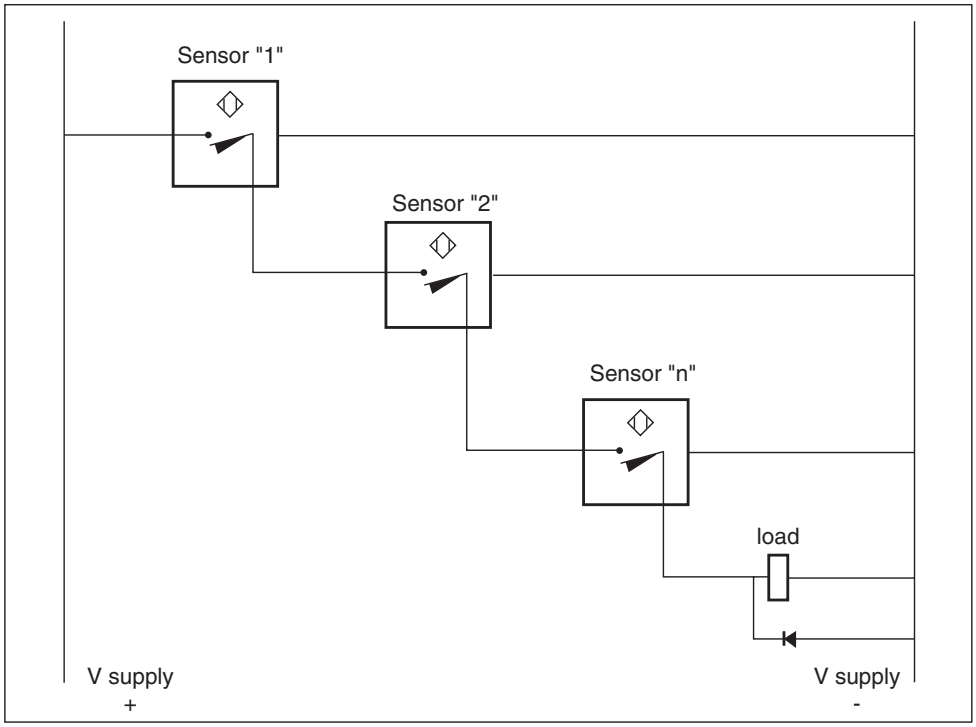
3. When all sensors are ON, a small voltage drop is present across each sensor; the resultant loss of voltage at the load will be the sum of the individual voltage drops, and the load voltage should be selected accordingly.

4. **Series connection is only possible for sensors with a wide voltage range.**

Example: Four sensors rated at 24-240 Vac can be wired in series at 120 V because even at 90%, V supply = 108 V. When all sensors are OFF, each will see 108/4 = 27 V, which is higher than the minimum voltage rating of the switch (24 V).

© 1997-2002 Schneider Electric All Rights Reserved

Wiring two or more sensors in series 3 wire type



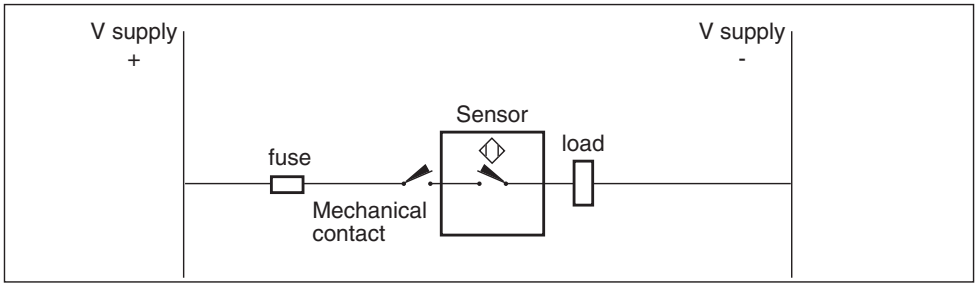
The following points should be considered:

1. Sensor 1, when conducting its load current, will also carry the leakage currents of all other sensors.
2. Each sensor, when conducting, will produce a voltage drop of 2.6 V, maximum. The load voltage should be selected accordingly.
3. Sensor 2 is powered only when Sensor 1 turns ON. Only after its power-up delay will Sensor 2 be able to function properly. This delay should be taken into consideration when speed is a factor.
4. Use of “flywheel” diodes is recommended where an inductive load is being switched.

© 1997-2002 Schneider Electric All Rights Reserved

Wiring in series

Wiring proximity sensors in series with mechanical contact devices



The following points should be considered:

1. When the mechanical contact is open, the sensor is not supplied.
2. When the contact closes, the proximity sensor will not operate until a certain time “T” has elapsed, corresponding to the **power-up delay**. Please refer to details of individuals sensor characteristics

Wiring several sensors in parallel 2 wire type

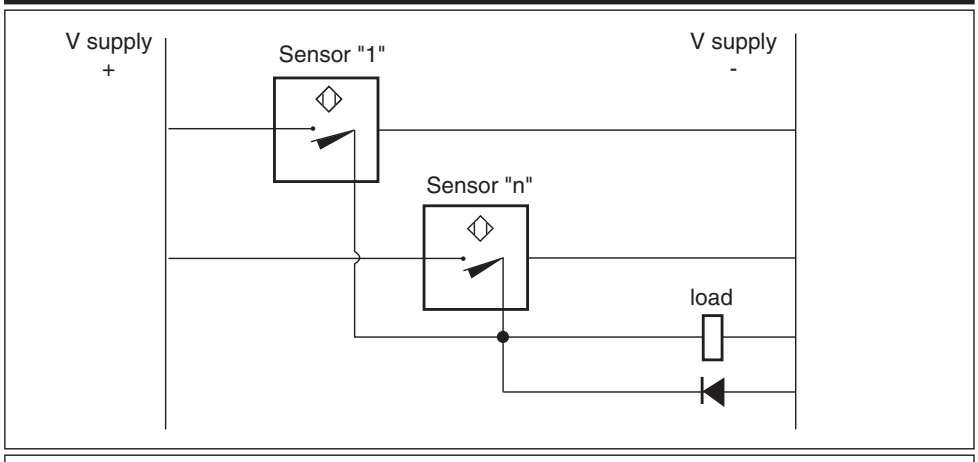
The use of proximity sensors wired in parallel either between themselves or together with mechanical contacts is not recommended.

When one of the sensors is in the ON state, the sensor in parallel is “shorted out” and thus no longer supplied.

As the first unit passes into the OFF state, the second sensor will become energized and will be subject to its power-up delay. This configuration is used where the sensors are working alternately.

When the sensors are OFF, the sum of the leakage currents must be less than the holding current of the load.

3 wire type



No restriction

© 1997-2002 Schneider Electric All Rights Reserved

Precautions

Length of the cable

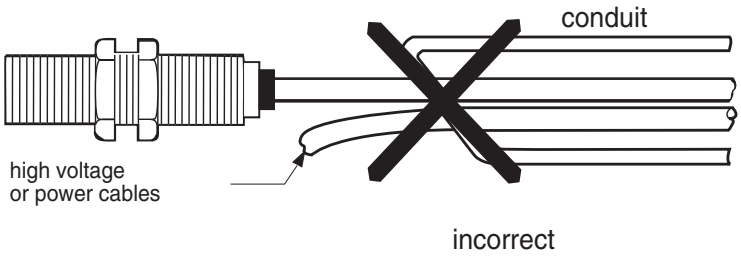
No restrictions up to 660 feet (200 meters) or up to a line capacitance of 0.1 µF. It is important to take into account voltage drop on the line over 660 feet (200 meters).

The XS models are immune to electrical interference encountered in normal industrial conditions.

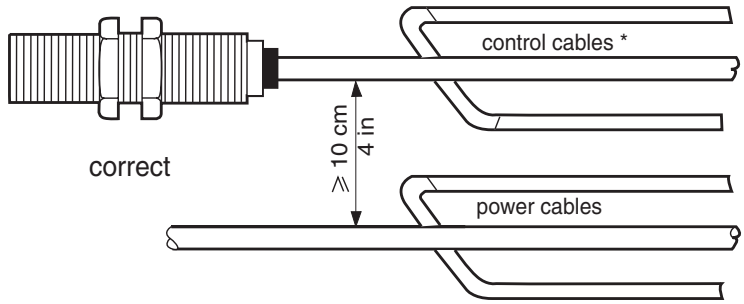
Where extreme electrical noise conditions could occur (large motors, spot welders, etc.) it may be advisable to protect against transients in the following ways:

Suppress interference at source, limit the length of the cables, separate power and control wiring from each other, ensure that the logic systems contain input transient suppression means and use twisted pair and shielded cables.

Separation of power and control wiring



Incorrect



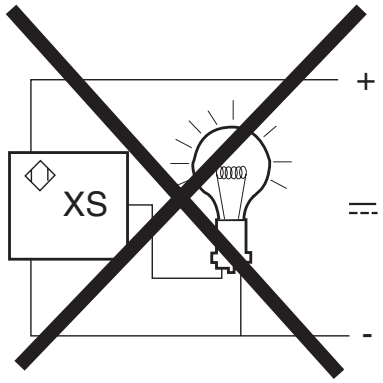
Correct

* Use of individual cables is recommended if long lengths are involved.

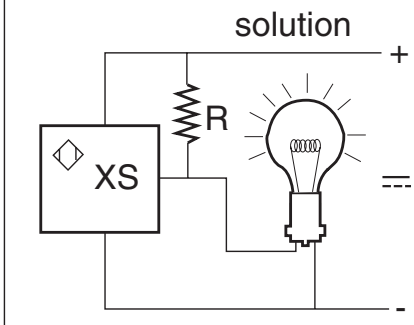
© 1997-2002 Schneider Electric All Rights Reserved

Precautions

Electrical connections to be avoided



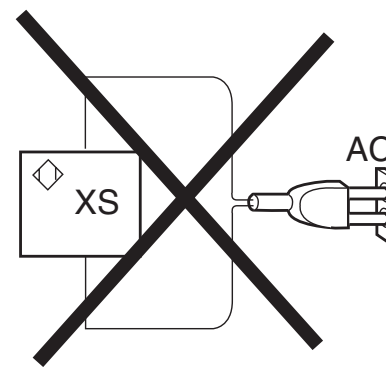
If the load consists of an incandescent lamp, the cold state resistance can be ten times lower than the hot state resistance. This can cause very high current levels on switching



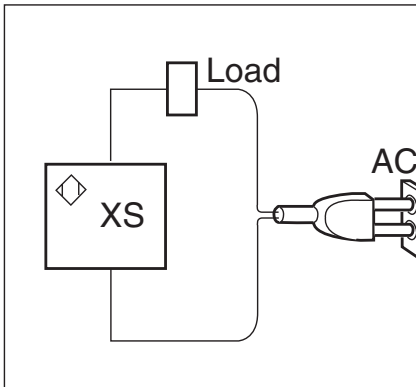
Install a pre-heat resistance in parallel with the proximity sensor.

$$R = \frac{V^2}{P} \times 10$$

V= supply voltage
P= power of lamp



An XS proximity sensor cannot be connected directly to an AC supply source. This would result in immediate destruction of the sensor and considerable danger to the operator (except short circuit protected switches)



A suitable load (see product data) must be connected in series with the proximity sensor.

© 1997-2002 Schneider Electric All Rights Reserved

Problems	Possible cause	Remedial action
The sensor's output will not change state when a metal target is moved within its operating zone.	*Output failure, or the short circuit protection has operated.*	*• Check that the sensor is the correct one for the supply being used.* *• Check the load current.* *Characteristics:* *- If load current is greater than the max. rated current, a relay should be interposed between the sensor and the load.* *- If load current is lower than the nominal rated current, check for wiring faults which could have caused a short circuit. In any case, a fast-blow fuse should be wired in series with the sensor (AC).* *- For a tubular sensor, if the sensor is brand new, check the mounting torque.*
	Wiring error *Supply problems*	*• Check the wiring.* *• Check voltage range.* *• Check that the supply voltage falls within the operating limits of the sensor in question. Remember that with a rectified supply: Vpeak = Vrms x $\sqrt{2}$*
False or erratic operation with or without the presence of the target object.	*Transients*	*• Install transient suppressors across potential sources (coils, arcing contactors)*
	Influence of surrounding metal	*• Refer to the instruction sheet supplied with the sensor.*
	Effect of interference on the supply lines	*• Ensure that any DC supplies when derived from rectified AC, are correctly filtered ($C \geq 400\ \mu f$)* *• Ensure that AC power cables are run separately from low level DC cables.* *• Where very long distances are involved, use suitable cable:* *- shielded and/or twisted pair* *- suitable wire gage* *• Position the sensor as far away as possible from any source of interference.*
	Response time of the sensor too long for the particular target.	*• Check suitability of the sensor for the target; choose a sensor with a faster response time or use a longer target.*
	Effects of high temperature	*• Eliminate sources of radiated heat, or protect the housing with a heat shield.*

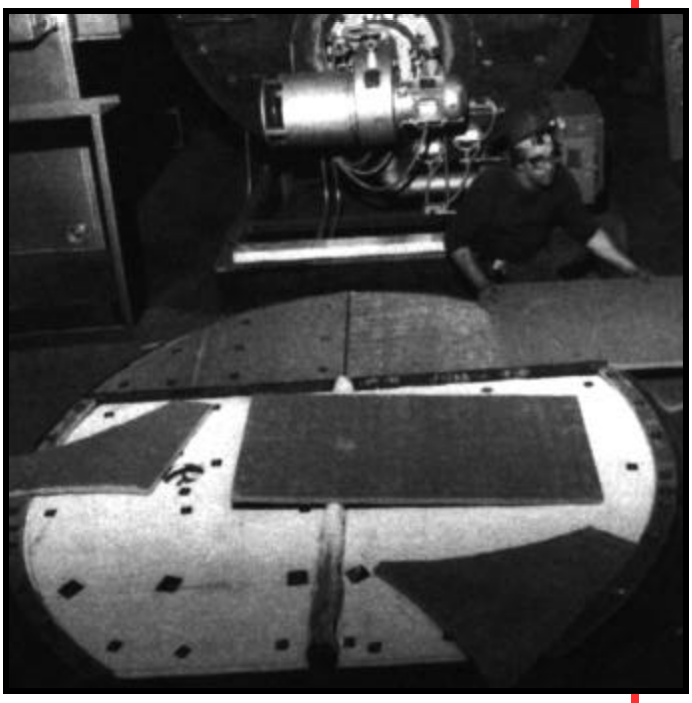
Thermafiber®

K-FAC® 19

HIGH-TEMPERATURE BOARD

STRONG • DURABLE • EASILY APPLIED • NON-ASBESTOS

For insulation of high-temperature ovens, furnaces, kilns, vessels



Low-Cost, Effective Insulation

K-FAC 19 High-Temperature Board provides high strength and excellent workability. It is composed of mineral fiber and selected mineral additives. An organic binder that will dissipate above approximately 475°F is used for low-temperature handling. On initial start-up, heat rise should not exceed 15°F per minute to allow the binder to dissipate without excessive temperature rise. This will occur only on the first startup and will not adversely affect the insulation value. An inorganic binder system allows K-FAC 19 High-Temperature Board to be used at service temperatures to a maximum of 1900°F on the hot surface of the enclosed panel only. Not to be subjected to direct flame impingement as a hot face material. The density allows K-FAC 19 High-Temperature Board to meet a variety of installation requirements.

Versatile Uses

Widely used in applications on precipitators, dryers, ducts and breeching, utility boilers, furnaces, kilns, etc., where high-temperature insulating materials are required.

Rapid Application

Exceptional strength and easy handling allow use of large-size boards to reduce labor costs. Material can be cut quickly by hand with knife or saw for fabrication and application on the job. Attachment is by impaling on pins or studs.

Noncorrosive

K-FAC 19 High-Temperature Board will not cause or sustain corrosion of steel or aluminum finishes as tested per HH-1-558B.

Low Temperature Insulating Firebrick

Product Information

Thermal Ceramics was first to introduce insulating firebrick (IFB) to the industry in the 1930's. The IFB are manufactured with a unique slurry casting process which creates a network of microporosity which produces low thermal conductivity and good thermal shock characteristics. This process produces brick that are some of the most efficient insulators available in the market. The anorthite mineralogy ($CaO \cdot Al_2O_3 \cdot 2\ SiO_2$) of these low temperature IFB gives them excellent strength at operating temperatures and resistance to corrosive alkali environments.

Features

- Extremely low "K" factors
- Low densities
- Low heat storage
- Excellent strength at room and high temperatures
- Excellent resistance to alkali attack
- Excellent service in applications involving special atmospheres

Applications

- Backup insulation for carbon baking furnaces
- Backup insulation in aluminum electrolytic cells
- Electrical kilns for industrial and hobby use
- Backup insulation for blast furnace stove linings
- Linings for carbonizing furnaces
- Forge furnace linings
- Heat transfer linings

Physical Characteristics

16. RF Conveyor Chain Checkpoints 30
17. Warning Statement 31

This information is intended to provide general guidelines for roller chain and conveyor chain installation and maintenance. Consult Tsubaki of Canada Limited for specific application problems.

1 Chain Construction

RS Roller Chains and RF Conveyor Chains consist of alternate connections of roller links and pin links. The roller link consists of a roller plate to which two bushings with rotating rollers are press-fit. This roller link is alternately connected to the pin link plate in which two pins have been securely press-fit.

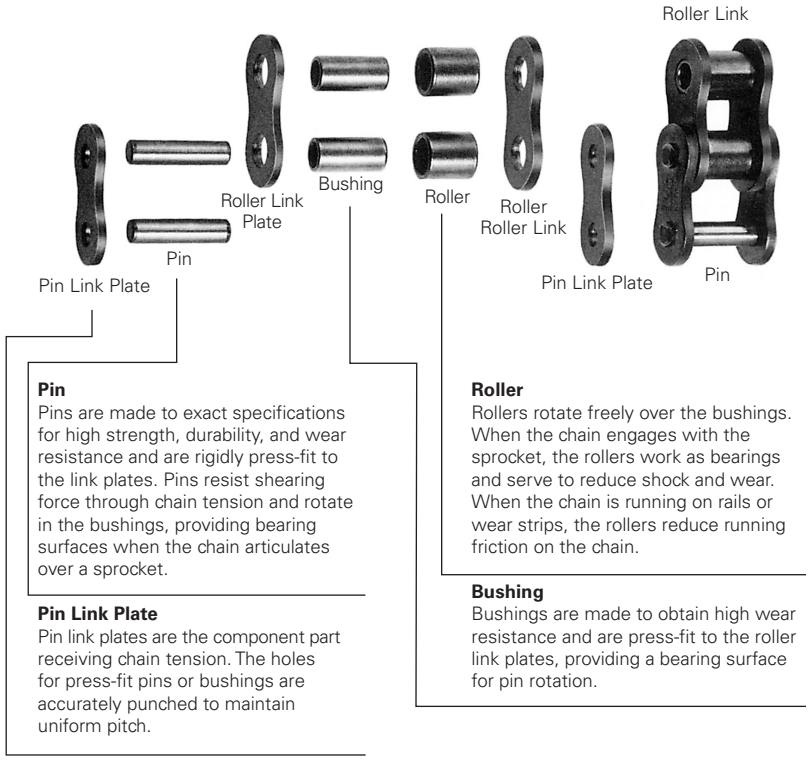

Figure 1-1: RS Roller Chain Construction

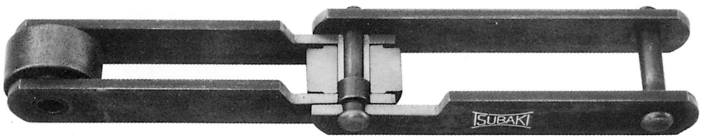

Figure 1-2: RF Conveyor Chain Construction

2 RS Roller Chain Connecting Links

Tsubaki Roller Chain links can be easily connected using one of two types of connecting links. Though an offset type of connecting link is available for the connection of an odd number of links, it is best to use regular links whenever possible.

Connecting Links

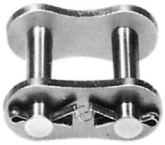
Tsubaki uses two types of connecting links and, generally, two types of fasteners for RS Roller Chain:

1. A regular connecting link with either a spring clip or cotter pin type fastener
2. A special, high-performance, gold-colored connecting link also with a spring clip or cotter pin type fastener

A spring clip is used for links sized RS60 and smaller. For chain sized RS80 and larger, or for three to six strands of RS40 or RS50 chain, a cotter pin is best. A roll pin type is used for chain sized RS240.

The regular connecting link has lower fatigue strength than the gold link but is easy to use and handle. The regular type is suitable for most power transmission applications and has ample strength to withstand relatively high loads over a long period of time. The high-performance gold connecting link is preferred for severe conditions such as high impact or heavy loads and for applications with high-speed drives. The gold connecting link is durable and has fatigue strength almost equal to that of the chain itself. The gold connecting link is easily recognized by its distinctive color.

Spring Clip



Cotter Pin

Figure 2-1: Standard Connecting Link

Spring Clip

Cotter Pin

Figure 2-2: Gold-colored Connecting Link

Offset Links

One-pitch and two-pitch offset links are available for RS Roller Chain. Two-pitch offset links consist of a roller link and an offset link with a riveted pin, as shown in Figure 2-3. The gold type connecting link can be used on both ends of the two-pitch offset link for increased capacity.

The one-pitch offset link is relatively easy to handle but should be confined to lighter loads and medium- to low-speed applications with reduced start-and-stop frequency and low-impact loads.

Two-pitch Offset Link

One-pitch Offset Link

Figure 2-3: Offset Links

Note: Two-pitch offset links for RS41 chain and one-pitch offset links for RS25 chain are not available.

3 How to Connect RS Roller Chain

For easy connection and installation:

1. Wind the chain around one of the sprockets so that the free ends are separated by one sprocket tooth.
2. Insert the connecting link into the two end links of the chain.
3. Install the free connecting link plate and fasten the plate using the spring clip or cotter pin fasteners supplied.

If layout prevents the use of sprocket teeth:

1. Wind the chain around the sprockets so that the free ends come together in the area between the sprockets.
2. Pull the chain ends together and insert the connecting link using a chain puller or by hand.
3. Install the free connecting link plate, then insert and secure the fasteners.

For both methods, be sure to tap the ends of the chain pins after the fasteners have been inserted. By tapping the ends of the pins, the fasteners will rest snugly against the outside of the connecting link plate. This will help the chain to flex freely and smoothly as it goes around the sprocket and allow better penetration of lubricant and greater fastener life.

An offset link must be used when an odd number of pitches is required. However, because the allowable working load is considerably lower than that of the base chain or standard connecting link, the use of offset links should be avoided if possible. Instead, it is better to add one link and take up the extra slack by varying the center distance between the shafts or installing an idler.

Notes:

1. The gold-colored connecting link is made to fit exactly with the pin. Do not make the link plate holes larger or the diameter of the pin smaller, as doing so may damage the chain or reduce its life and performance.
2. For cotter pin type construction, a regular pin link can be used as a substitute for the connecting link. To prevent chain damage or increased wear, the pin link must be carefully driven onto the pin parallel to the connecting link.

Figure 3-1: Connecting RS Roller Chain on a Sprocket

4 How to Disconnect RS Roller Chain

There are two relatively simple methods for disconnecting RS Roller Chain. One way is to use a chain vise and punch. The other is to use a chain breaker.

Using a Chain Vise

1. For riveted type Tsubaki Roller Chain, first grind down one end of the pin to be removed. For cottered type chain, be sure to take out the cotter pin.
2. As shown in Figure 4-1, put the chain into the vise groove and tighten the vise to secure the chain.
3. Hit the head of the pin with a punch or hammer. Be sure to hit the pins alternately for even removal.

Note: For riveted types, be sure to grind off the riveted part of the pin. If the pin is taken out without grinding, it will take more time and may damage the chain. Chain vises and punches are available for RS40 to RS240 chain.

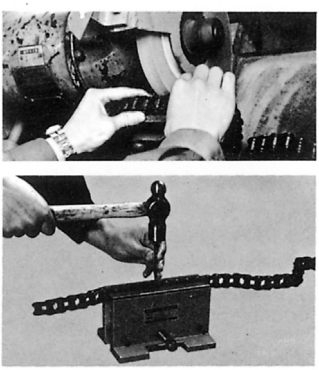


Figure 4-1: Disconnecting RS Roller Chain

Table 4-1: Chain Vise Selection

No. of Strands \ Chain No.	RS40	RS50	RS60	RS80	RS100	RS120	RS140	RS160	RS180	RS200	RS240
1	CV-1										
2		CV-2				CV-3					
3								Not In Stock			

■ Indicates CV-1 ■ Indicates CV-2 □ Indicates CV-3

Notes:

1. For overlapping parts, a smaller chain vise is easier to use.
2. These chain vises can also be used for double-pitch chain other than RS Roller Chain.

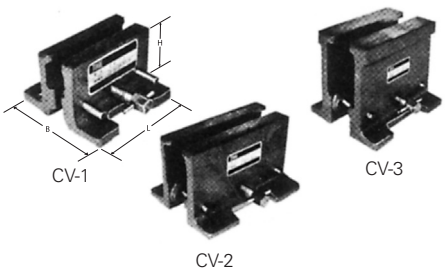

Figure 4-2: Chain Vise Types

Table 4-2: Chain Vise Dimensions mm (in.)

Type	L	H	B
CV-1	100 (3.94)	65 (2.56)	94 ~ 115 (3.70 ~ 4.53)
CV-2	180 (7.09)	110 (4.53)	120 ~ 151 (4.72 ~ 5.94)
CV-3	200 (7.87)	170 (6.69)	180 ~ 220 (7.09 ~ 8.66)

Using a Chain Punch

When using a chain punch, be sure to draw both pins out together. Link plates cannot be used again once the pins have been removed.

RS40 ~ RS60	S-1	D-1	For RS40
RS80 ~ RS120	S-2	D-2	For RS50 For RS60
RS140 ~ RS240	S-3	D-3	For RS80

Using a Chain Breaker

A chain breaker is a tool made for cutting chain. The chain breaker does not require a firm working table and can cut chain already set on a machine. RS25 and RS35 chains require a chain breaker.

Table 4-4: Chain Breaker Selection

Chain No. / No. of Strands	RS25	RS35	RS41	RF06B	RS40	RS50	RS60	RS80	RS100	RS120	RS140	RS160	RS180	RS200	RS240
1	CS-A1	CS-A2	CS-A3	CS-A4	CS-B1			CS-C1		CS-C2		CS-C3			
2															

Notes:

1. A4 type, B type, C type, and two-strand A type are made to order; all others are from stock.
2. This series can also be used with BS Roller Chain and Tsubaki Marine Chain. A specially manufactured breaker for Marine Chain is also available.

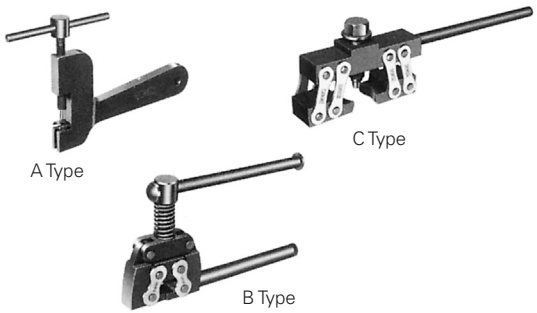

Figure 4-4: Chain Breaker Types

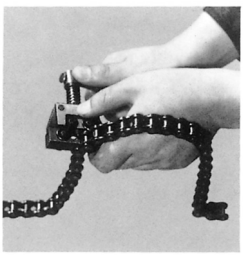

Figure 4-5: Using the Chain Breaker

5 Sprockets for RS Roller Chain

Good quality sprockets are essential for maximum power transmission efficiency. The tooth configurations of Tsubaki Sprockets conform to JIS and ANSI standards. All Tsubaki Sprockets are precision components with finely balanced boss and rim parts that are exactly in accordance with Tsubaki of Canada Limited stated specifications.

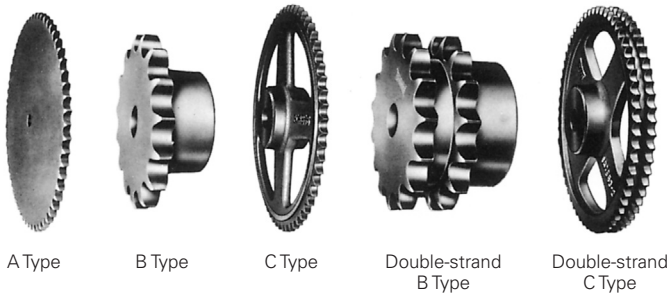

Figure 5-1: Sprocket Types

Sprocket Materials

Suitable sprocket materials should be selected according to the working conditions and requirements of the application. Proper selection will result in higher performance and better cost-effectiveness.

Table 5-1: Sprocket Materials

Sprocket Type	Material
A Type	Low Carbon Steel
B Type	High Carbon Steel
C Type	Ductile Cast Iron (RS40~RS120) Cast Iron (RS140~RS160)

High Frequency Hardening for Tips of Sprocket Teeth

Roller chain is often used for high-speed power transmission. For these applications, use standard sprockets with fewer teeth that have been hardened at the tooth tips by high frequency hardening, such as single-row, B Type Sprockets for RS35~RS100 chain and double-row, B Type Sprockets for RS40~RS100.

Hardening for the tips of sprocket teeth is required in the following cases:

1. For sprockets with up to 24 teeth used at speeds of more than one-eighth of the maximum speed specified for RS Roller Chain
2. For small sprockets and speed ratios of more than 1:4
3. For use with heavy loads at low speeds
4. For use in abrasive conditions

Shaft Hole Processing

If the shaft hole is to be processed by the customer, processing should be based on the tooth bottom. Keyway and shaft hole dimensions are required for processing done by Tsubaki of Canada Limited.

6 Sprocket Installation

Careful and accurate sprocket installation is required for smooth operation and maximum chain and sprocket life.

Sprocket Alignment

1. Level each shaft, checking the adjustment with a level applied directly to the shaft. The incline should be adjusted within the range of ±1/300.

Figure 6-1: Shaft Alignment

2. Align the shaft for parallelism using a scale. Parallelism of the shafts should be adjusted so that the incline is within the range of ±1/300 (A-B/L).

Figure 6-2: Shaft Parallelism

3. Check the axial alignment of the sprocket using a straightedge or scale. The following are the tolerances based on the distance between the shafts.

Up to 1 m (3.3 ft.):	± 1 mm (0.04 in.)
1 m (3.3 ft.) to 10 m (33 ft.):	± Distance between 2 shafts/1,000
More than 10 m (33 ft.):	± 10 mm (0.39 in.)

Figure 6-3: Axial Alignment

4. Attach the sprockets using keys, collars, set bolts, etc., as necessary.

7 RS Roller Chain Lubrication

All Tsubaki Roller Chain is pre-lubricated with a special high-grade lubricant before packing. Tsubaki's lubricant has been specially developed to thoroughly penetrate all parts of the chain, especially the critical areas where the pin and bushing surfaces articulate with each other while the chain is under a full load.

Proper roller chain lubrication is essential for peak performance and maximum chain life. Follow the lubrication schedule and recommendations carefully. Improper lubrication will shorten chain life and decrease operating performance.

Since wear between pins and bushings causes chain elongation, lubrication must be maintained on all contact surfaces. Proper lubrication forms an oil film that:

1. Reduces abrasion and chain wear
2. Reduces chain friction and noise
3. Functions as a coolant when chain is run at high speeds
4. Functions as a cushion against impact

Lubricant for roller rhain must be selected and applied according to the application and working conditions of the chain. Once applied, the lubricant should not be wiped off with a cloth or washed with certain solutions, such as TriClean™.

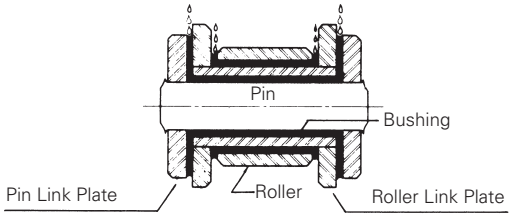

Figure 7-1: Proper Penetration of Lubricant

The lubricant should penetrate the areas shown in Figure 7-1.

Recommended Lubricants

Only high-grade oil of suitable viscosity should be used for RS Roller Chain lubrication. The amount and type of oil depends on the chain specifications, working conditions, and lubricating system.

Oils to avoid:

1. Heavy oil (except under special conditions)
2. Low-grade oil
3. Impure oil or grease
4. Used oil

These types of oil should not be used as they do not lubricate the chain effectively and will reduce service life or cause chain damage or breakage.

TriClean™ is a trademark of TriSep Corporation, Goleta, CA.

Table 7-1: Lubrication Selection Temperature is in °C (°F)

Lubricating System	A, B				C			
Temp. / Chain No.	-10°~0° (14°~32°)	0°~40° (32°~104°)	40°~50° (104°~122°)	50°~60° (122°~140°)	-10°~0° (14°~32°)	0°~40° (32°~104°)	40°~50° (104°~122°)	50°~60° (122°~140°)
RS50 or smaller	SAE 10	SAE 20	SAE 30	SAE 40	SAE 10	SAE 20	SAE 30	SAE 40
RS60 and RS 80	SAE 20	SAE 30	SAE 40	SAE 50				
RS100					SAE 20	SAE 30	SAE 40	SAE 50
RS120 or larger	SAE 30	SAE 40	SAE 50					

Lubricating System and Quantity of Oil Applied

The following lubricating systems are recommended. Refer to the Tsubaki of Canada Limited Guide to Products and Specifications for system selection.

	Method	Quantity of Oil
System A 	**Manual Application** Oil is applied with an oil filler or brush to the slack side of the chain.	Oil should be applied at a fixed interval, generally about every eight hours, or as often as necessary to prevent the bearing areas from becoming dry.
	**Drip Lubrication** A simple case can be used. Oil from the oil cup is supplied by drip feeding.	Five to 50 drops of oil per minute are necessary for every strand of chain. Actual quantities depend on operating speed.
System B 	**Oil Bath Lubrication** The chain is installed in a leak-free casing.	Depth "h" from oil surface to chain should be 6 mm (.25 in.) to 12 mm (.50 in.). If "h" is too high, the composition of the oil may change due to the heat generated and reduce its effectiveness.
	**Lubrication by Rotating Disc** Oil can be splashed on the chain using a rotating disc installed in a leak-free casing. For this method, speed along the circumference of the disc should be more than 200 m/min. (656 ft./min.). If chain width is more than 124 mm (4.9 in.), use a rotating disc on both sides.	The clearance "h" between the oil surface and the lowest position of the chain should be from 12 mm (.50 in.) to 25 mm (1.0 in.).

	Method	Quantity of Oil
System C 	**Lubrication by Pump** The chain is contained in a leak-free case and a pump is used to circulate and cool the oil. When the number of chain strands is "n," "n + 1" lubrication supply holes are necessary.	Oil should be supplied according to Table 7-2.

Table 7-2: Quantity of Oil for Lubrication Using a Pump ℓ/min. (gal./min.)

Chain Speed m/min. (ft./min.)	Chain No.			
	RS60 and smaller	RS80 ~ RS100	RS120 ~ RS140	RS160 and larger
500 ~ 800 (1,600 ~ 2,600)	1.0 (0.26)	1.5 (0.40)	2.0 (0.53)	2.5 (0.66)
800 ~ 1,100 (2,600 ~ 3,600)	2.0 (0.53)	2.5 (0.66)	3.0 (0.79)	3.5 (0.92)
1,100 ~ 1,400 (3,600 ~ 4,600)	3.0 (0.79)	3.5 (0.92)	4.0 (1.06)	4.5 (1.19)

Regardless of the lubricating system used, roller chain should be washed periodically with petroleum or gasoline. Examine the pin and bushing to confirm the effectiveness of the lubrication. The appearance of a red or reddish-brown color is usually the result of insufficient lubrication.

8 RS Roller Chain Installation and Layout

Speed Ratio and Chain Lap
The speed ratio of RS Roller Chain can range up to 7:1 under normal conditions. However, a speed ratio of 10:1 is possible if the required speed is very slow. Chain lap on the small sprocket must be at least 120 degrees.

Distance Between Shafts
Optimum distance between sprockets is 30 to 50 times the pitch of the chain, except when there is a pulsating load. In such cases, the distance can be up to 20 times the pitch of the chain.

Layout
When arranging the roller chain drive, the centerline of both sprockets should be as close to horizontal as possible, though the angle of installation can be up to 60 degrees. If installation is close to vertical, slight chain elongation can cause the chain to easily slip off the sprockets. In this case, an idler or guide stopper is recommended.

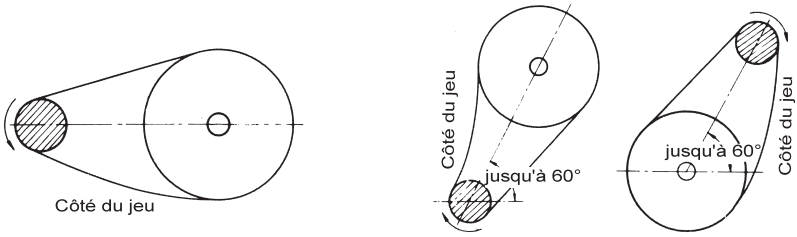

Figure 8-1: General Arrangement

Note: Driving shaft is shown by oblique lines.

It is best to keep the angle of installation within 60 degrees. If the angle must be more than 60 degrees, refer to the instructions for vertical centerlines (No. 3) in the next section.

Layouts Requiring Attention

1. If the slack side is on top, consider the following to eliminate extra chain slack:

   If the driving distance is short, adjust the center distance between the sprockets.

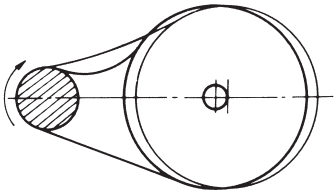

Figure 8-2: Short Driving Distance

If the driving distance is long, adjust chain slack by installing an idler as shown in Figure 8-3.

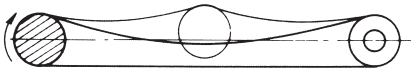

Figure 8-3: Long Driving Distance

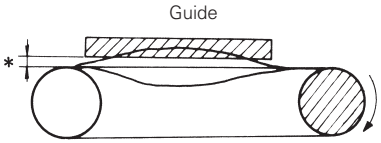
2. For pulsating loads caused by high chain speed:

   A stopper will help to prevent vibration. Chain vibration is often caused by the tune of the chain's individual frequency, by the impact period of the driven shaft, or by chordal action of the chain.



*Clearance between the chain and guide stopper should be 2 mm (.781 in.) to 4 mm (.156 in.).

Figure 8-4: Guide Stopper

3. For vertical centerlines:

   Install an idler to eliminate extra chain slack. When the driving shaft is on the lower side (A), an idler is essential.

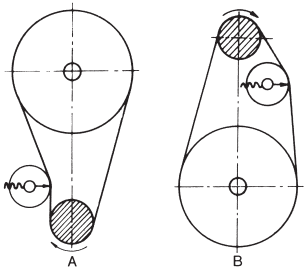


Figure 8-5: Vertical Centerlines

Roller Chain Tension

Initial tension for roller chain power transmission is not as critical as for belt transmission. Generally, roller chain is used with adequate slack. Slack on the lower side is most desirable.

If the chain is excessively tight, chain damage or rapid use of lubricant may result. If the chain is too loose, damage due to vibration or chain winding may result.

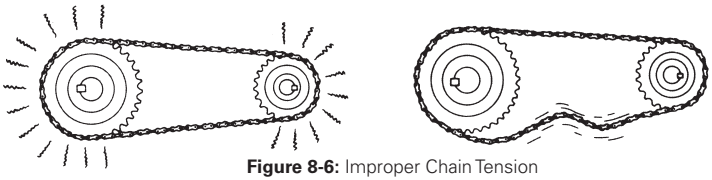

Figure 8-6: Improper Chain Tension

Slack (S S') should be adjusted to four percent of the chain span (AB). For example, if the chain span is 800 mm (31.5 in.), slack should be: 800 mm (31.5 in.) • 0.04 = 32 mm (1.26 in.)

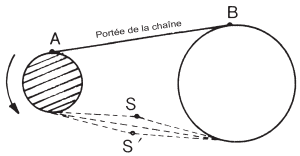

Figure 8-7: Measuring Chain Slack

Slack should be adjusted to approximately two percent in the following situations.

1) Vertical power transmission (idler is required)
2) Distance between the shafts is more than 1 m (3.3 ft.)
3) Heavy loads and frequent starting
4) Sudden backward rotation

The chain will elongate slightly from the beginning of initial operation from 0.05 to 0.1 percent of the full length. As this causes extra slack, adjustment is required. A tensioner can be used to take up the slack or the shaft can be adjusted to minimize chain elongation.

Trial Run

A trial run should be performed before regular operation to check for the following:

1. Proper fit of the connecting link plate (and spring clip or cotter pin)
2. Adequate chain slack
3. Sufficient lubrication
4. No contact between chain and its case
5. No abnormal noise
6. No excessive vibration
7. Chain does not wind around the sprocket
8. No kinks or stiff chain parts

If any problems are discovered, re-install the chain and sprocket, referring to the checkpoints on pages 16 and 17.

9 RS Roller Chain Checkpoints

Chain life is generally considered to have expired when the chain does not engage properly with the sprocket due to elongation or damage of its parts. When this occurs, it is usually necessary to replace the chain.

A long, trouble-free working life can be achieved if chain is properly selected for the conditions of its application. To help prevent damage or premature wear, inspect the chain and sprockets for:

1. Abnormal noise
2. Chain vibration
3. Chain rising on the sprocket
4. Chain winding around the sprocket
5. Kinks or stiff bending of chain
6. Amount and state of lubrication
7. Contact between chain and case
8. Chain appearance. Check for dirt, corrosion, damage on the outside surface of the roller, contact marks, etc. Also check the inside edge and surfaces of the link plates and the surface edges of the pins
9. Damage on the sprocket tooth surfaces and side surface teeth and engaging areas
10. Abrasive stretch of the chain
11. Bending of chain and rotation of roller

Checkpoints

1. Lubrication

While the chain is in operation, check that the lubricating oil moves toward the link plates and that the chain or rotating disc is immersed in the oil bath. When the chain is stopped, check for dirt or abrasive particles produced by improper lubrication. When the chain is removed, the connecting link pin and the inside edge of the bushing should be checked. Damage or a red or reddish-brown color signal improper or insufficient lubrication.

2. Link Plate

Chain exposed to repeated loads over the allowable load can develop fatigue breaks in the link plate. Fatigue breaks are difficult to anticipate until they produce a crack. Cracks usually develop at the edge of a hole or at the side of the link plate as shown in Figures 9-1 and 9-2. Check link plates often for cracks to prevent accidents.

Figure 9-1: Positions where Cracks are Likely to Develop

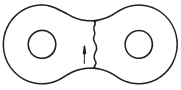

Figure 9-2: Example of an Expanding Crack

3. Roller Link

Care should be taken to avoid repeated impact loads over the allowable load as fatigue breaks may occur. The roller should be checked in the same way as the link plate. If foreign objects interfere with the engagement of the roller and sprocket, the roller may be damaged and a crack may develop. Chains damaged by fatigue breaks must be replaced.

Figure 9-3: Crack Produced on the Roller

4. Sprocket

Chain and sprocket engagement can be checked by observing the roller and sprocket tooth surfaces. A proper margin (A) and improper margin (B) are shown in Figure 9-4. Installation should also be checked. Normal margin position is slightly above the tooth bottom. If tension remains on the slack side, the roller will touch the tooth bottom slightly. If an idler or tightener is used, the margin will be at the center of the tooth bottom.

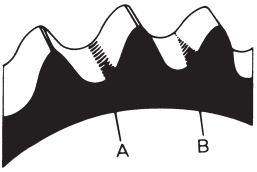

Figure 9-4: Areas to Check for Sprocket Wear

5. Chain Elongation

Chain stretch is calculated as the total amount of elongation caused by wear on the pin and bushing, not including deformation of the link plate. Measuring chain elongation can help estimate the remaining life of the chain.

Measuring Chain Elongation

1. Stretch the chain slightly.
2. To get distance (L), use a vernier to measure the distance of the inside (L_1) and outside (L_2) of the rollers at both ends of the measured links.

$$L = \frac{(L_1 + L_2)}{2}$$

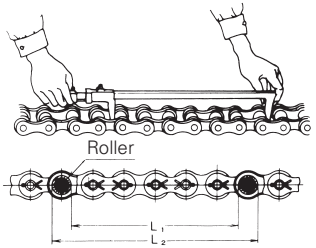

Figure 9-5: Measuring Chain Elongation

3. Use the following equation to calculate chain elongation:

$$\text{Chain Elongation (L)} = \frac{\text{(Measured Length – Standard Length)}}{\text{Standard Length}} \times 100(\%)$$

Where:
Standard Length = Chain Pitch X Number of Links

Note: Measure at least six to ten links to minimize errors. A tape measure can be used if a vernier is not available. Because tape measures are less accurate, the measured length should be as long as possible.

Table 9-1: Maximum Allowable Chain Elongation

No. of Teeth of Driving Sprocket	Chain Elongation (%)
60 or less	1.5
61 ~ 80	1.2
81 ~ 100	1.0
100 or more	0.8

Table 9-2: Standard Length and 1.5% Elongation mm (in.)

No. of Links	Length	RS25	RS35	RS41	RS40	RS50	RS60	RS80
6	Standard	38.10 (1.50)	57.15 (2.25)	76.20 (3.00)	76.20 (3.00)	95.25 (3.75)	114.30 (4.50)	152.40 (6.00)
	1.5% Elongation	38.67 (1.52)	58.01 (2.28)	77.34 (3.05)	77.34 (3.05)	96.68 (3.81)	116.01 (4.57)	154.69 (6.09)
10	Standard	63.50 (2.50)	95.25 (3.75)	127.00 (5.00)	127.00 (5.00)	158.75 (6.25)	190.50 (7.50)	254.00 (10.00)
	1.5% Elongation	64.45 (2.54)	96.68 (3.81)	128.91 (5.08)	128.91 (5.08)	161.13 (6.34)	193.36 (7.61)	257.81 (10.15)
No. of Links	**Length**	**RS100**	**RS120**	**RS140**	**RS160**	**RS180**	**RS200**	**RS240**
6	Standard	190.50 (7.50)	228.60 (9.00)	266.70 (10.50)	304.80 (12.00)	342.90 (13.50)	381.00 (15.00)	457.20 (18.00)
	1.5% Elongation	193.36 (7.61)	232.03 (9.14)	270.70 (10.66)	309.37 (12.18)	348.04 (13.70)	386.72 (15.23)	464.06 (18.27)
10	Standard	317.50 (12.50)	381.00 (15.00)	444.50 (17.50)	508.00 (20.00)	571.50 (22.50)	635.00 (25.00)	762.00 (30.00)
	1.5% Elongation	322.26 (12.69)	386.72 (15.23)	451.17 (17.76)	515.62 (20.30)	580.07 (22.84)	644.53 (25.38)	773.43 (30.45)

Checking Chain Accessories

Check for damage to any metal fittings and make sure fittings are as secure as possible. Loose-fitting attachments may reduce the life of the chain. Generally, a tolerance up to H8 or H9 is permitted for the pin hole diameter.

10 Use Under Special Conditions

Generally, roller chain should be used in relatively clean air and in temperatures of 10°C to 60°C (50°F to 140°F). Refer to the chart below when operating outside this temperature range.

Ambient Temperature	Comments
-50°C ~ -30°C (-60°F ~ -20°F)	Use a special cold-resistant material.
-30°C ~ -10°C (20°F ~ -15°F)	1. Use a lubricating oil for extremely low temperatures. 2. Power transmission efficiency will be reduced.
60°C ~ 150°C (140°F ~ 300°F)	Use a lubricating oil for high temperatures.
150°C ~ 260°C (300°F ~ 480°F)	1. Use a lubricating oil for very high temperatures. 2. Since the wear resistance of the chain is reduced, a larger chain size is recommended.
260+°C (480+°F)	1. Use a lubricating oil for extremely high temperatures. 2. Heat-resistant steel must be used or chain hardness will decrease and chain strength will be significantly reduced.

Use in Wet Conditions

If a chain is splashed with water or runs through heated vapor, such as in a sterilizing machine or water screen, the following problems may occur:

1. An increase in abrasive stretch due to improper or insufficient lubrication.
2. Shortened chain life due to oxidation of the chain material.

In such cases, take the following measures:

1. Decrease bearing pressure by using a larger chain size.
2. Use plated or stainless steel chain.
3. Use a more suitable lubricant.

Use in Acidic or Alkaline Conditions
Exposure to acids will increase chain wear. Brittleness and breakage may occur when standard mechanical abrasion is compounded by chemical corrosion. Acids are more damaging to chain than alkali. Electrochemical corrosion caused by seawater or pit water may also occur. In these cases, chain should be plated or manufactured with corrosion resistant materials.

Use in Abrasive Conditions
Abrasion occurs when sand, coke, metal particles, or dust in the air becomes embedded in the moving or engaging parts of the chain and sprocket. Take the following steps when operating under these conditions:

1. Reduce bearing pressure by using a larger chain size.
2. Increase wear resistance by applying special processing to the parts of the chain where abrasion is a problem.

11 How to Connect RF Conveyor Chain

Unless otherwise specified, new conveyor chains are usually supplied in 3 m (10 ft.) lengths to facilitate handling. The chains are manufactured in even numbers of pitches, with an inner link at one end and an outer link at the other end for easy joining.

To connect the chain:

1. First, fit the pin holes of the outer link plate to the bushing holes to be connected and insert the pins.

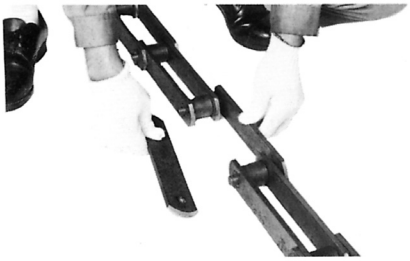

Figure 11-1: Inserting the Pins

2. Hold the counter plate with a hammer (A) and tap the pin heads with another hammer (B) until the pins are completely inserted into the link plate.

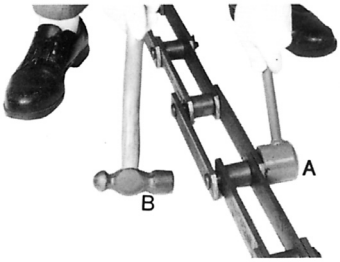

Figure 11-2: Putting on the Link Plate

3. Insert new T-pins or cotter pins into the bearing pins and bend the ends to prevent them from coming loose.

Figure 11-3: Inserting New T-pins or Cotter Pins

4. Check that the chain has smooth flexibility and is free of kinks.

12 How to Disconnect RF Conveyor Chain

Like RS Roller Chain, RF Conveyor Chain from Tsubaki can be easily taken apart, either manually or with a vise or chain breaker.

1. Begin by removing the bent T-pins or cotter pins where the chain is to be cut.

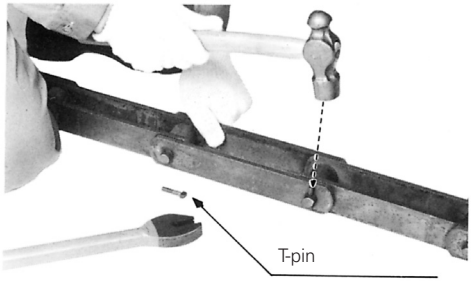

Figure 12-1: Removing the T-pins or Cotter Pins

2. Hold the link plate on the pin head side with a tool and from the opposite side, tap the pin with a hammer until it dislodges.

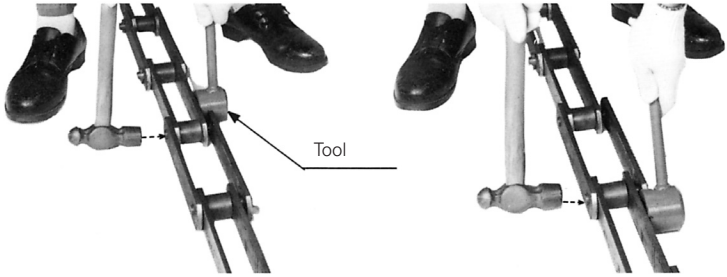

Figure 12-2: Dislodging the Pins

3. Now the chain can be disconnected.

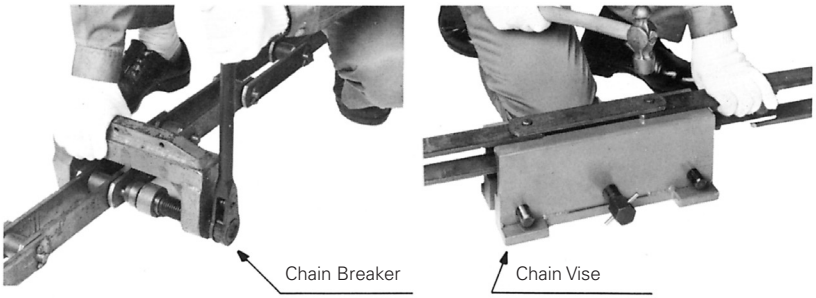

Figure 12-3: Using a Chain Breaker and Chain Vise

13 RF Conveyor Chain Lubrication

As with other power transmission chains, Tsubaki Conveyor Chains require proper lubrication. Good lubrication reduces wear, economizes horsepower, and reduces chain pulsation. Lubrication should be applied once per week by dripping or brushing Turbine Oil #75 - #120 into crevices as shown in Figure 13-1. For conveyor chains with grease pockets, grease should typically be supplied every six months.

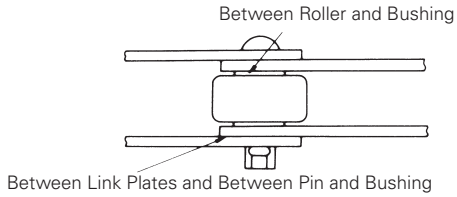

Figure 13-1: Important Conveyor Chain Lubrication Points

Automatic Lubrication System
An automatic lubrication system can be used to save labor or when system configurations prevent manual lubrication.

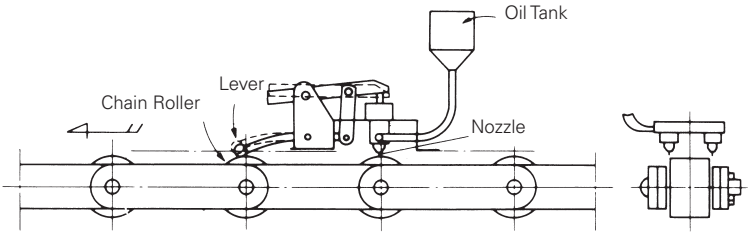

Figure 13-2: Automatic Drip Lubrication

The automatic drip lubrication system pictured in Figure 13-2 utilizes the chain roller as a cam. The roller pushes up a pump lever as it passes by, causing the oil to drip.

This lubricator, however, cannot be used when the conveyor chain functions as an overhead trolley conveyor or when the chain requires many lubrication points. In these cases, a mist type lubricator operated by compressed air is recommended. For coil conveyor chain, an automatic grease feeder is available.

Where Lubrication is Ineffective
In most cases, lubrication is ineffective for bulk conveyors that convey powdery and granular materials. For flow or trough conveyors, the chain buries itself in the material as it moves in the conveying direction. Dust or other particles can become embedded in the chain and reduce or eliminate the lubricant effects of the oil.

14 RF Conveyor Chain Installation and Layout

Adjustment of Chain Tension
The correct amount of chain slack is essential for proper chain operation. When the chain is too tight, working parts such as sprocket wheels, shafts, bearings, etc., carry a much heavier load. However, too much chain slack is also harmful and causes the chain to climb the sprocket teeth.

Frequency of Adjustment
Chain has a tendency to stretch a certain amount at the beginning of operation due to slight distortion of its component parts. After such initial elongation, the chain stretches slightly, but constantly, through normal wear. To maintain proper chain tension, necessary adjustments should be made at regular intervals.

Frequency of adjustment:

First week of operation:	Once per day
Second to fourth week:	Twice per week
Thereafter:	Twice per month

Note: This frequency schedule is based on daily eight-hour operation. If working hours are increased, the frequency of adjustment should be increased accordingly.

Even Adjustment of Take-up on Both Sides
This can be easily obtained with cooperating screw type or counterweight type take-ups. When two parallel chains are adjusted by two independently operated take-ups, care must be taken to ensure an even stroke on both the left and right sides. Uneven adjustment will cause the link plate and the side of the sprocket teeth to interfere with each other and result in an overload position.

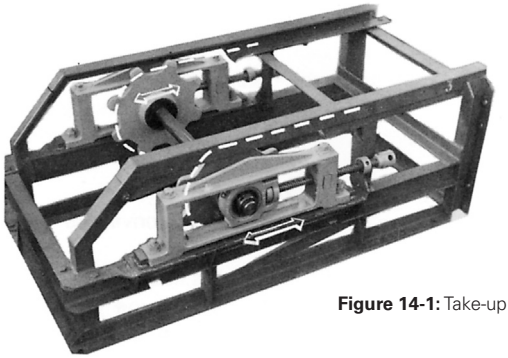

Figure 14-1: Take-up Units

Insufficient Take-up Adjustment
If the chain is still too long after complete take-up adjustment, shorten it by removing two links.

Adjustment of Chain Tension for Flow Conveyor

F Type Flow Conveyor

Proper chain tension for the Tsubaki F Type Flow Conveyor can be determined using the following formulas.

Where:

h = amount of chain slack just behind the head sprocket

L = distance between the sprocket and take-up

1. When material to be conveyed is within a normal temperature range:
   h = 0.1250 X L
2. When material to be conveyed has a high temperature range:
   h = 0.0625 X L

To adjust chain slack, it is best to have two people working as a team: one to observe the chain slack at the head section and the other to adjust take-up at the tail section. Adjustments should be made for normal load conditions.

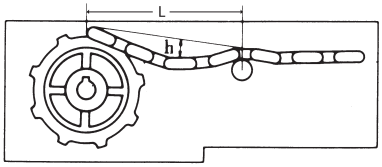

Figure 14-2: Measuring Chain Slack

L Type and S Type Flow Conveyors

Chain tension for Tsubaki L Type and S Type Flow Conveyors is adjusted by inspecting the chain slack through the inspection door located at the side of the curved section of the casing. Chain slack should be adjusted so that it is at the center of the curved section. Too much tension will cause the chain to rub against the casing, and excessive slack can cause the chain to tangle and break. Proper chain slack can be determined using the following formulas.

Where:

a = distance from the centerline of the chain to the casing

L = distance from the casing to the rail

1. When material to be conveyed is within a normal temperature range:
   a = 0.5000 X L
2. When material to be conveyed has a high temperature range:
   a = 0.2500 X L

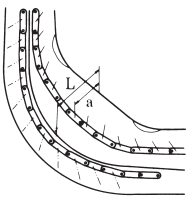

Figure 14-3: Chain Slack for L Type and S Type Flow Conveyors

15 Life of RF Conveyor Chain and Sprockets

After a certain period of time, wear will eventually appear on the chain and sprockets. The life of conveyor chain depends on the wear of each component part and on pitch elongation. Periodic inspection of conveyor chain is required more frequently than for roller chain.

The life of conveyor chain component parts is shown below. Periodic inspection of the wearing parts, proper maintenance, and an established schedule for changing the chains is essential for optimum service life.

Roller Life

When wear between the rail, bushing, and roller causes the under surface of the link plate to contact the rail, the chain has usually reached the end of its usability. As shown in Figure 15-1, when the link plate begins to contact the rail, rolling contact becomes sliding contact between the link plate and rail and results in greater wear, increased chain tension, and reduced horsepower. Such wear generally appears on horizontal or inclined apron conveyors, slat conveyors, etc.

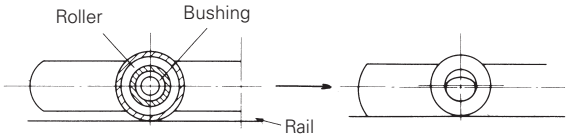

Figure 15-1: Roller Wear

On a curved section of rail, the allowed wear amount is decreased by dimension (S) and requires additional monitoring.

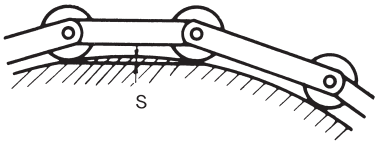

Figure 15-2: Wear on Curved Rail Section

When holes or crevices due to wear appear on the rollers, the chain life has expired.

Bushing Life

Bushings are generally usable until holes appear. Holes may appear as a result of conveying abrasive materials such as iron ore powder, coke, etc.

Link Plate Life

Reciprocal friction between the inner and outer link plates and contact between the side surface of the roller and the inside surface of the link plate causes wear such as (A) and (B) shown in Figure 15-3.

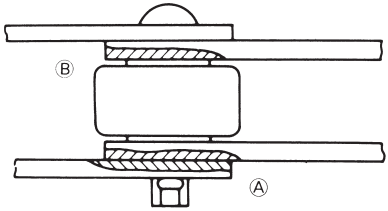

Figure 15-3: Link Plate Wear

Wear that exceeds one-third of the original plate thickness will reduce the tensile strength of the chain. Link plate wear that appears faster than wear on other component parts is usually caused by misalignment of the conveyor during installation. Misalignment can also develop during conveyor operation. Check for the following to ensure maximum working life:

1. Correct alignment of driving and driven sprockets
2. Correct alignment of shafts in horizontal and vertical planes
3. Precision of level gauge and accurate leveling

The link plates on Tsubaki Flow Conveyor Chain move directly on the material to be conveyed or on a steel plate casing. The working life expires when the worn section equals A/2 or H/8, as shown in Figure 15-4.

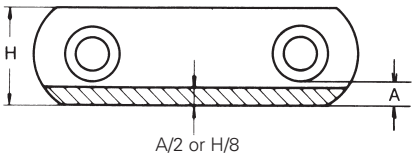

Figure 15-4: Maximum Allowable Link Plate Wear

Pitch Elongation

When the chain engages with the sprocket or runs on a curved rail section, the chain flexes, which causes the chain to stretch. In most cases, this is caused by wear of the bearing parts, such as pins and bushings. As chain pitch elongation increases, the chain tends to climb the top of the sprocket and prevents smooth conveyor operation. The limit of pitch elongation is generally two percent of the chain pitch.

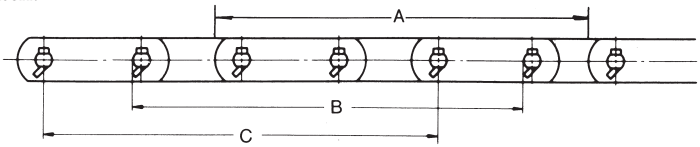

Figure 15-5: Places to Measure Chain Elongation

Figure 15-6 indicates the way to measure chain pitch. Using a steel tape measure, measure as many pitches as possible (at least four are required). Measure length (A), (B), or (C) as shown in Figure 15-5, depending on the wear condition of the chain. The chain pitch elongation per link is determined by comparing the actual pitch to the original chain pitch.

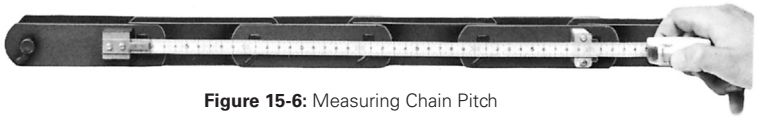

Figure 15-6: Measuring Chain Pitch

Sprocket Life

When the sprocket is worn, chain tends to cling to the sprockets and vibrate. The amount of allowable wear depends on the conveyor type and chain size. Generally, wear to a depth of 3 to 6 mm (0.12 to 0.24 in.) is a sign that the existing sprocket should be repaired or replaced to ensure continued chain life. The following measures can extend sprocket life:

1. Cut section (A) shown in Figure 15-7 with a grinder.
2. Reverse the sprocket to change the engaging area of the teeth.
3. Use a welding rod to obtain the correct tooth profile. However, it is generally more effective to replace the sprocket with a new one.

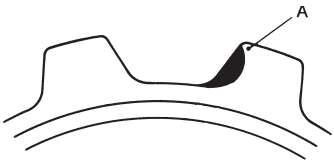

Figure 15-7: Sprocket Wear

If the sprocket teeth are worn as shown in Figure 15-8, sprocket alignment may be incorrect. Proper axial alignment of the sprockets will help reduce or eliminate this type of wear.

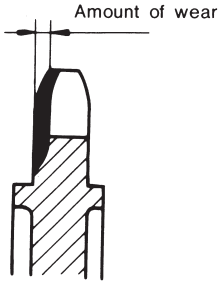

Figure 15-8: Sprocket Tooth Wear

Wear Characteristics of Conveyor Chain

1. Mechanical Wear
When conveyor chain is used under normal operating conditions, mechanical wear causes the bearing surface of the chain to shine brightly. Proper lubrication ensures longer wear life.

2. Wear Caused by Conveyed Material
Materials having excessive wear characteristics tend to stick to the chain and wear its surface due to reciprocal friction between the chain and material. Care should be taken to prevent material from falling on the chain under these conditions. For extra protection, specify chain with higher wear resistance.

3. Wear Due to Corrosion
Conveyor chain used in applications where acidic or alkaline chemicals are present will be subject to corrosive wear as well as mechanical wear. To protect against chemical corrosion accompanying mechanical wear, use corrosion-resistant chain.

4. Electrochemical Corrosion
When chain is splashed with water and then enters a chemical solution, the surface of the sliding area (i.e., pin/bushing, bushing/roller) is exposed to electrochemical corrosion, one of the most damaging types of corrosion.

Tsubaki is constantly researching ways to improve the performance of our chains by testing combinations of different materials. Please inquire about our complete line of chains for special environments.

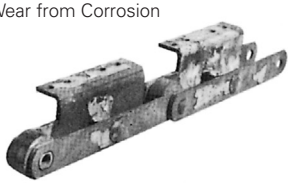
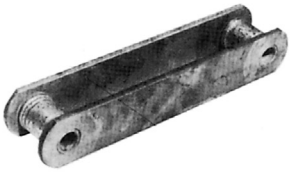
3. Wear from Corrosion



2. Wear from Conveyed Materials



4. Electrochemical Corrosion

Figure 15-9: Types of Wear

16 RF Conveyor Chain Checkpoints

Maintenance Checkpoints

Checkpoints	Comments
Centering	A high-precision guide rail is essential to ensure proper centering of the conveyor. If centering is not accurate (with no side guide rail), the conveyor chain will wear and wobble, resulting in shorter chain life.
Sprocket alignment	When two or more sprockets are installed in a row, be sure to align the position of the sprocket teeth. If the sprocket teeth are not properly aligned, the working load will not be equally divided and will cause the chain to twist.
Take-up	If take-up on both sides is uneven, the conveyor chain will not engage smoothly with the sprocket.
Initial chain tension	Maintain adequate chain slack. If chain tension is too high, loss of power will result and can be dangerous. If chain tension is too loose, the chain will climb the sprocket.
Trial run	A trial run after installation should be made under no-load conditions by switching the conveyor on and off several times intermittently. Continuous operation may begin after inspection.
Stopping a conveyor	Stop a conveyor under no-load conditions or remaining material will cause an overload when the system starts again.
Lubrication	Lubricate conveyor chain periodically, except for conveyors that require no lubrication, such as Flow Conveyors. Lubrication is essential for reducer, bearing, and driving roller chain.
Securing conveyor parts	Parts fastened to a conveyor, such as buckets, aprons, slats, etc., are apt to loosen due to vibration. Be sure to fasten nuts and bolts securely and check them periodically.
Amount of chain slack	Regularly check and adjust the amount of chain slack.
Temperature	When differences in temperature, such as summer and winter or between day and night in winter, are severe, conveyor damage may occur. Under these circumstances, operate the conveyor carefully, taking any variations in temperature into account.
Conveyor use and maintenance record	After installing the conveyor, prepare a record of the expected capacity to be conveyed, conveyor speed, r.p.m. of main shaft, electric current, voltage, working hours, actual conveying capacity, inspection date, lubricating date, details of trouble, etc. This will serve as protection against unexpected accidents and is also convenient for maintenance and repairs.

This information is intended to provide general guidelines for roller chain and conveyor chain installation and maintenance. Consult Tsubaki of Canada Limited for specific application problems.

17 Warning Statement

⚠ WARNING

USE CARE TO PREVENT INJURY COMPLY WITH FOLLOWING TO AVOID SERIOUS PERSONAL INJURY:

1. Guards must be provided on all chain and sprocket installations in accordance with provisions of ANSI/ASME B15.1 — 2000 "Safety Standards for Mechanical Power Transmission Apparatus," and ANSI/ASME B20.1 — 2000 "Safety Standards for Conveyors and Related Equipment," or other applicable safety standards. When revisions of these standards are published, the updated edition shall apply.

2. Always lock out the power switch before installing, removing, lubricating or servicing a chain system.

3. When connecting or disconnecting chain:
   a. Eye protection is required. Wear safety glasses, protective clothing, gloves and safety shoes.
   b. Support the chain to prevent uncontrolled movement of chain and parts.
   c. Use of pressing equipment is suggested. Tools must be in good condition and properly used.
   d. Do not attempt to connect or disconnect chain unless you understand chain construction, including the correct direction for pin/rivet removal or insertion.
   e. Do not attempt to rework damaged chains by replacing only the components obviously faulty. The entire chain may be compromised, and it should be discarded.

4. Other cautions:
   a. **Alterations and Repairs** to chains should be made only by qualified personnel with parts and components authorized by Tsubaki of Canada Limited.
   b. **Electroplating of Assembled Chains** is not condoned. Plating of assembled chains could result in failure from hydrogen embrittlement.
   c. **Inspect Chains** for shipment damage before installation. During operation, all chain systems should be inspected on a regular schedule. Visually check for worn, damaged and broken parts caused by improper installation or maintenance, abnormal stress, temperature, humidity, abrasion or corrosion, possible interference with other system components and improper lubrication. (For correct lubrication procedures and systems, consult the Tsubaki of Canada Limited Guide to Products and Specifications.)
   d. **Heating Chain** with a cutting torch is not suggested unless absolutely necessary for removal. If cut in such a manner, it should not be reused.
   e. **Welding** should not be performed on any chain or component.
   f. **Average Ultimate Strength** of a chain means the average load at which it will break when subjected to a destructive tensile test. *It does not mean working load.* For complete information, contact Tsubaki of Canada Limited Technical Support Department.
   g. **Product Dimensions** in this catalog are subject to changes and are intended for general reference only. For exact current dimensions, request certified prints from Tsubaki of Canada Limited.

Driving your business.

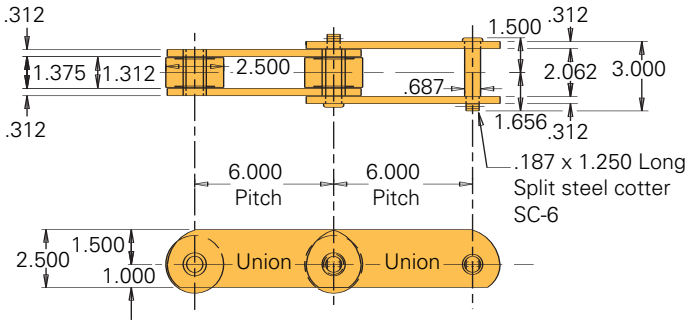
High Sidebar Roller Conveyor Chain/ CC5 Chain

CC5 High Sidebar Roller Conveyor Chain is the most widely used conveyor chain in the auto industry, and no wonder:

- CC5 meets industry quality standards, which means better reliability for your application.
- CC5 rolls on any flat, firm surface, which means "instant conveying" for auto parts.
- CC5 can be customized, including welded-on flat tops, hex holes in sidebars for gravity roll conveyors, top rollers, and custom-specified attachments.



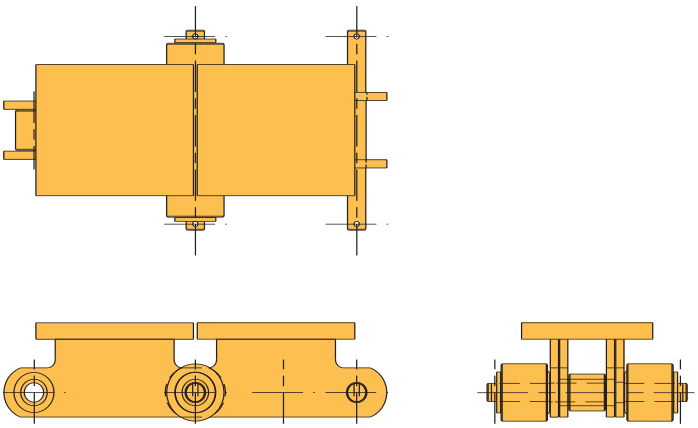
CC5 Specifications

Standard Ultimate Strength	50,000 lbs.
Max. Allowable Working Load	4,800 lbs.
Weight per Foot	11 lbs.

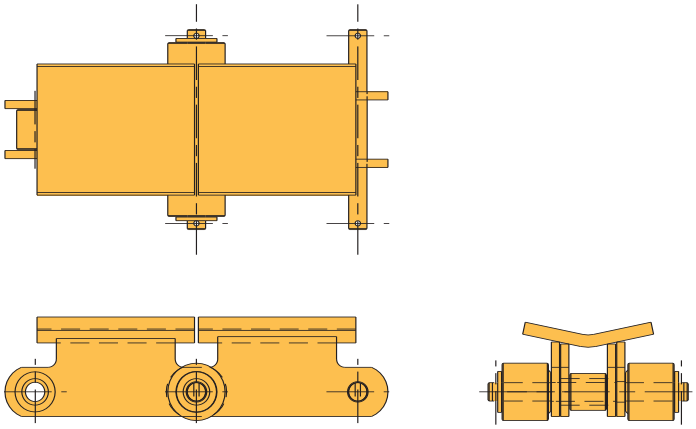
Flat Top and Gull Wing Chains

Double strand Flat Top Chain with outboard carrying rollers moves heavy loads with dependability. Top plate surfaces may be smooth, checkered, or nonskid. Chain pitch ranges from 4" to 24". Gull Wing Chain provides an alternative to Flat Top, keeping the conveyed materials in line during movement. Either style can be made from a variety of materials and heat-treated to stand up to extreme conditions.

Flat Top Chain



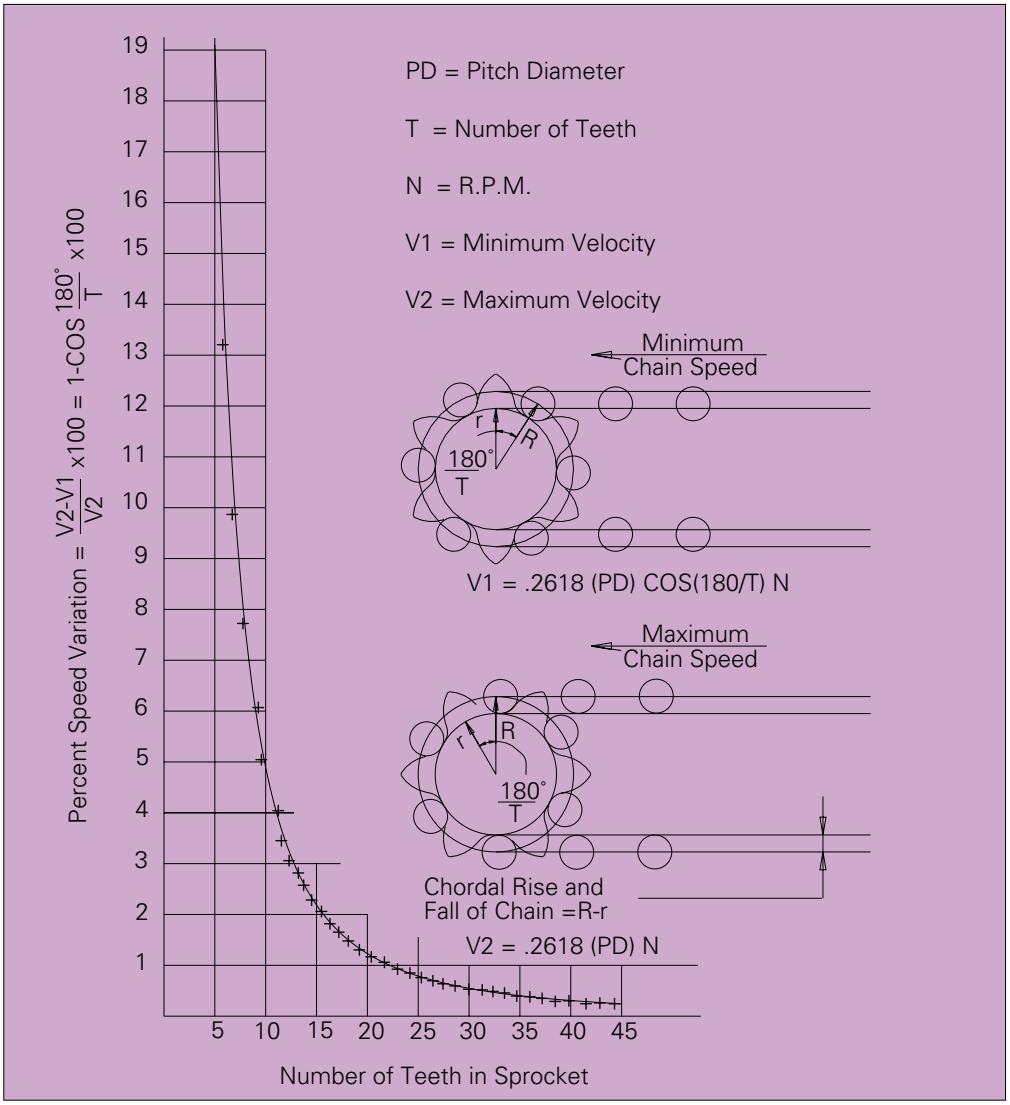
Gull Wing Chain



To locate compatible sprockets for your chain, refer to the Product Cross-Reference in Section D.

Note: Dimensions are subject to change. Contact Union Chain to obtain certified prints for design and construction.

Figure 3 — Variations in Chain Speed Due to Chordal Action



Sprocket Life

When sprockets are worn, the chain tends to cling to the sprockets or vibrate. The amount of allowable wear depends on the conveyor type and chain size. Wear to a depth of 0.12" (3 mm) to 0.24" (6 mm) is usually a sign that the existing sprocket should be replaced, illustrated in Figure 4.

If the sprocket teeth are worn, the alignment may be incorrect. Proper axial alignment of the sprockets will help reduce or even eliminate wear of sprocket teeth, illustrated in Figure 5.

Figure 4 — Sprocket Wear

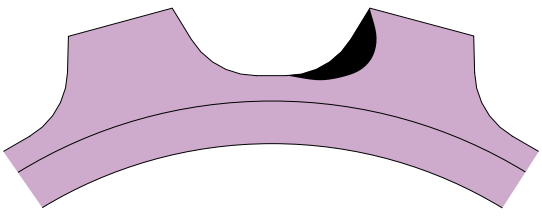


Figure 5 — Sprocket Tooth Wear

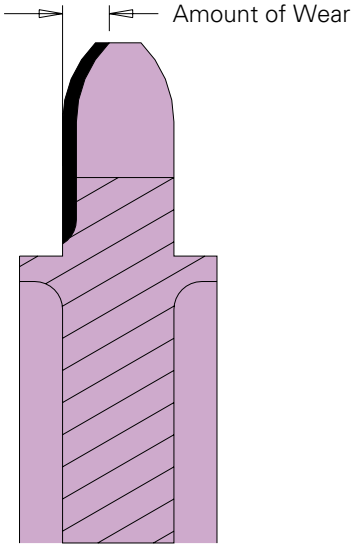
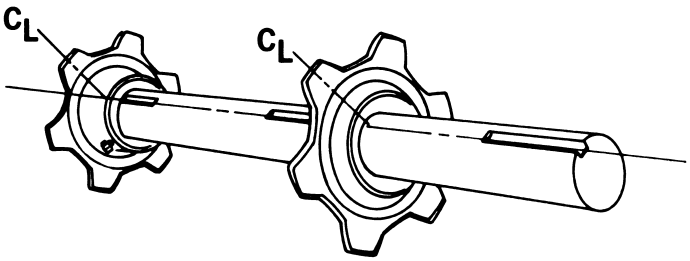


Sprockets

Sprockets Keyed In Line
Key driving sprockets on a double-strand chain conveyor or elevator on the head shaft and with the teeth of one sprocket directly in line with teeth of the other. Order "keyed-in-line" and "matched in pairs" to obtain this feature. Key one foot shaft sprocket on its shaft so that the shaft will turn in its bearings. Allow the other sprocket to turn freely, holding it in position by means of set collars. The sprocket can then position itself automatically if uneven wear takes place in the chain strands (Figure 1).

Figure 1



Sprocket Size
Use the largest diameter conveyor sprocket that space and economics permit. This minimizes chain speed variations and pulsations and reduces wear to the chain and sprocket.

Sprocket Terminology

Chain Interaction
Schedule replacement of sprockets and/or chain by assessing the chain-sprocket interaction. If the chain enters and exits smoothly without hanging up or snapping into place, replacement is not necessary. If a chain starts to hang up on the sprocket, reverse or replace the sprocket before damaging chain overload conditions can develop.

Reversible
If the sprockets are symmetrical from side to side they can be reversed. Almost all sprockets are reversible.

New Chain
New or reversed sprockets are required with any new chain. New sprockets will ensure proper chain interaction and will also provide maximum wear performance.

Visual Observation
Carefully observe the wear patterns on chains and sprockets. Wear patterns that are smooth and even indicate good chain-sprocket interaction; unbalanced or severe wear indicates that the system needs maintenance.

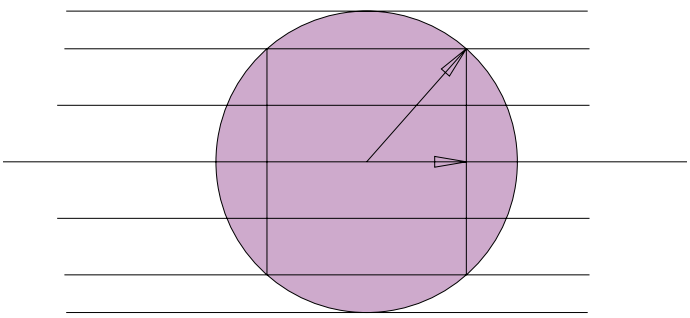
Attachment Clearance
Be sure that any attachment in the area between, above, or below the sidebars will not interfere with the sprocket.

Relief Pocket
In applications where material build-up may occur, the bottom of the tooth pocket is beveled on the side to allow the material to "squeeze" out.

Chordal Action
A sprocket is a collection of chords, or straight segments, that approximate a circle. With more teeth the chords approximate a circle better; with fewer teeth the chords do not approximate a circle as well.

The lineal output from a chordal form is not constant. The square in a circle shown in Figure 2 represents a four-tooth sprocket. Note that the distance from the center to the corner is different than from the center to the middle of the side. The corner would be the equivalent of the chain joint center; the side would be equivalent to the chain centerline at mid-pitch.

Figure 2



The resulting velocity variations are a function of the number of teeth, as shown in Figure 3. Due to these variations, care should be taken in considering sprockets with less than 12 teeth.

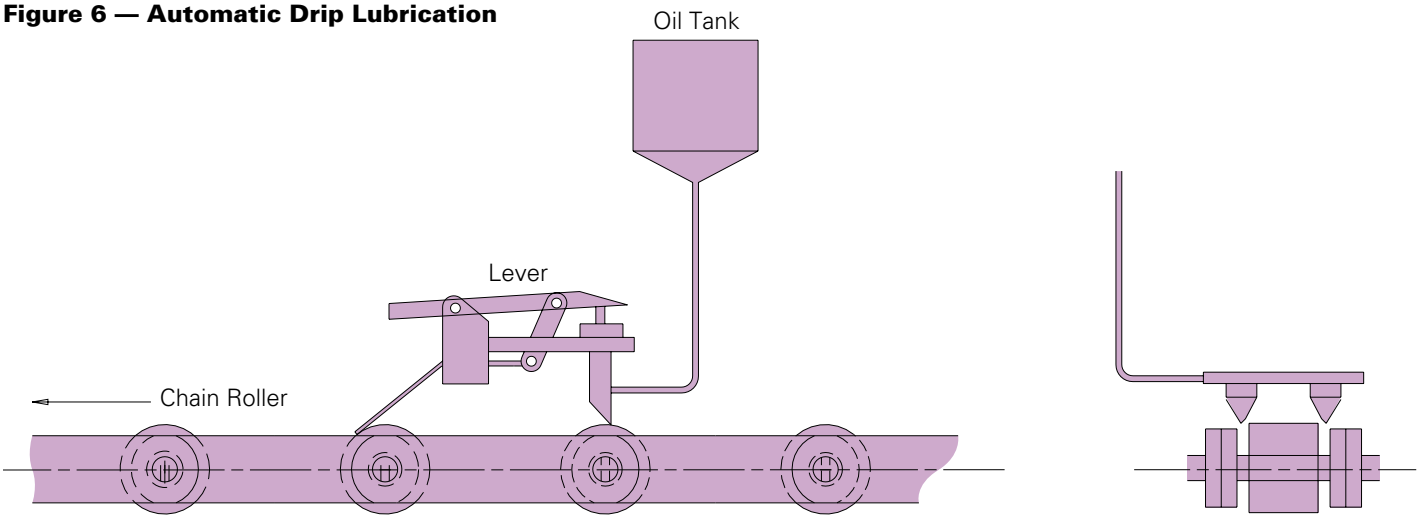
Maintenance Check Points

Check Points	Comments
Centering	A high precision guide rail is essential to ensure proper centering of the conveyor. If centering is not accurate (with no side guide rail), the conveyor chain will wobble and weave resulting in shorter conveyor chain life.
Sprocket alignment	When two or more sprockets are installed in a row, be sure to align the position of the sprocket teeth. If the sprocket teeth are not properly aligned, the working load will not be equally divided and will cause the chain to twist.
Take-up	If take-ups on both sides are uneven, the conveyor chain will not engage smoothly with the sprocket.
Initial chain tension	Maintain adequate chain slack. If chain tension is too high, loss of power will result. This is a dangerous situation and if too loose, the chain will climb the sprocket.
Trial run	Trial run after installation should be made under no load conditions by switching on and off several times intermittently. After inspection, continuous operation may begin.
Stopping conveyor	Stop conveyor under no load conditions, or remaining material will impose an overload when the conveyor starts again.
Lubrication	Lubricate conveyor chain periodically, unless the chain does not require lubrication. Lubrication of reducer, bearing, and driving roller chain is essential.
Securing conveyor parts	Parts fastened to the conveyor such as buckets, aprons, slats, etc., are apt to loosen due to vibration. Pay careful attention to fastening nuts and bolts securely. Be sure to check periodically.
Amount of chain slack	Regularly check and adjust the amount of chain slack.
Temperature and prevention of freezing	When differences in temperatures (summer and winter or between day and night in the winter) are very severe, conveyor damage may occur. Under these circumstances, operate the conveyor carefully, taking any variations in temperature into account.
Conveyor record of use and maintenance	After installing the conveyor, keep a record of the expected capacity to be conveyed, conveyor speed, r.p.m. of main shaft, electric current, voltage, working hours, actual conveying capacity, inspection date, lubricating date, details of trouble, etc. This will serve as protection against unexpected accidents. This record will also be convenient for maintenance and repairs.

Troubleshooting

Problem	Possible Causes	What to Do
Excessive noise	•Misalignment of sprocket •Loose casings or bearings •Too little or too much slack •Chain and/or sprocket wear •Inadequate lubrication or no lubrication •Chain pitch size too large	•Realign sprockets and shafts •Tighten set-bolts •Adjust centers or idler take-up •Replace chain and/or sprocket •Lubricate properly •Replace with correct chain size
Chain vibration	•Resonance to the vibration cycle of machine to be installed •High load fluctuation	•Change vibration cycle of chain or machine •Use torque converter or fluid coupling
Wear on inside of link plate and one side of sprocket teeth	•Misalignment	•Realign sprockets and shafts
Chain climbs sprockets	•Excessive chain slack •Heavy overload	•Adjust centers or idler take-up •Reduce load or install stronger chain
Broken pins, bushings or rollers or heavy wear of pins, bushings or rollers	•Chain speed too high for pitch and sprocket size •Heavy shock or suddenly applied loads •Material build-up in sprocket tooth pockets •Inadequate lubrication •Chain or sprocket corrosion	•Use shorter pitch chain or install larger diameter sprockets •Reduce shock load or install stronger chain •Remove material build-up or install side gashed sprockets •Lubricate properly •Install anti-corrosive chain or sprockets
Chain clings to sprocket	•Center distance too big or high load fluctuation •Excessive chain slack	•Adjust the center distance or install idler take-up •Same as above
Chain gets stiff	•Misalignment •Inadequate lubrication •Corrosion •Excessive load •Material build-up in chain joint •Peening of link plate edges	•Realign sprockets and shafts •Lubricate properly •Replace with anti-corrosive chain •Reduce load or replace with chain of suitable strength •Shield drive from foreign matter •Check for chain interference
Breakage of link plate	•Subjected to shock load •Vibration •Inertia load is too large	•Reduce shock (e.g., install a shock absorber) •Install a device to absorb vibration (e.g., tightener, idler wheel) •Chain section should be checked (increase number of strands or select next larger size chain)
Camber (curved tracking of straight faced roller chains on long conveyors where chain strands are rigidly attached)	•Head shaft sprocket misalignment •Track or rail out of level due to previous chain travel wear •Higher chain tension on one strand than the other strands •Chain strand lengths are different	•Realign head sprockets •Level track or rails •Balance conveyed material load between strands •Specify measured matched and tagged strands

Figure 6 — Automatic Drip Lubrication



Automatic Lubrication

Use automatic lubrication to save labor or when manual lubrication is not possible due to the location of the chain.

The automatic drip system shown in Figure 6 utilizes the chain roller as a cam. The roller pushes a pump as it passes by and causes the oil to drip.

Use a mist-type lubricator when the conveyor chain is used as an overhead trolley conveyor or when the chain requires many points to be lubricated.

For coil conveyor chain, an automatic grease feeder is suggested.

Lubrication is ineffective for bulk conveyors that convey powdery and granular materials. It will not work for flow or trough conveyors where the chain buries itself in the material as it moves and dust or other particles become embedded in the chain clearances.

Inspection

Lubrication

- Manual: Carefully follow lubrication schedule.
- Drip: Inspect the filling of oiler cups and the rate of feed. Check that the feed cups are not clogged and are properly positioned over the chain.
- Bath: Inspect the oil level and check that there is no sludge. Drain, flush and refill the system as the application requires.

If the chains have not been lubricated properly, the joints may have a brownish (rusty) color and the pins of the connecting link of the chain, when removed, may be a discolored brown. The pins may also be roughened, grooved, or galled. Properly lubricated chains will not show the brownish color at the joints; they will be brightly polished with a high luster.

- Check wear on link plates and sides of sprocket teeth indicating misalignment.
- Check shaft and sprocket alignment to prevent wear.
- Check wear on working faces of sprocket teeth. As the system runs these faces should develop a bright, polished appearance. Scratches, galls, grooves, or visible changes in tooth form are probably caused by lubrication failure or overloading.
- Check and adjust chain tension. An elongation of as much as five percent indicates that the chain is riding near its limit of allowable height on the sprocket teeth. A gradual increase in chain length is the result of normal wear. A sudden increase in slack indicates one or more of the following:
  - Lubrication failure
  - Excessive overloading or shock
  - Displacement of shaft bearings
  - Displacement or failure of take-ups
- Check the chain to be sure it is free from dirt, grit or other abrasive material. Clean the chain periodically.
- Check guides, tracks, and the area below the conveyor for buildup of material or dirt which will cause interference or binding of the chain. Exit and entry points of guides and tracks must permit the chain to pass with a minimum amount of impact or interference. Roller chain tracks can be over-lubricated, forcing the rollers to slide rather than roll.
- Exceptionally low chain conveyor speed coupled with high drag friction will occasionally cause surging. A slight increase in speed will correct this problem if the friction can not be reduced.
- Inspect apron and pan bead openings. If the beads have been wedged apart or otherwise distorted, fine material may bleed into moving parts and cause excessive wear.

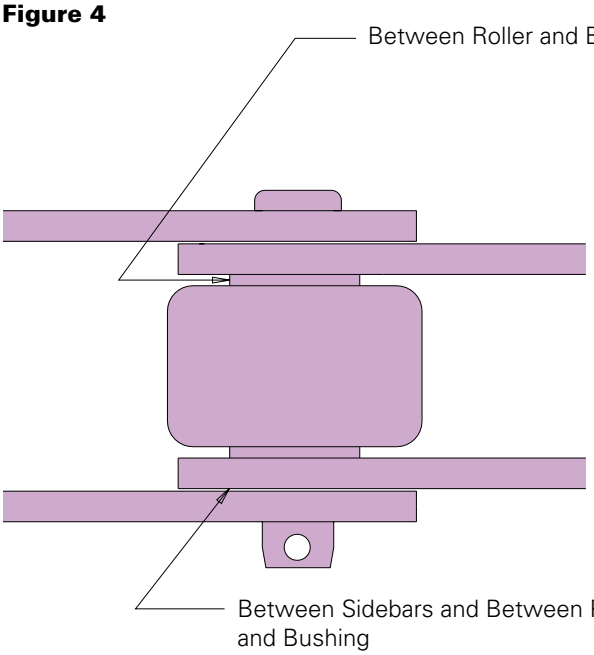
Lubrication

Proper lubrication reduces wear, maximizes horsepower, and helps reduce chain pulsation.

Important points of lubrication are shown in Figure 4.

- Between sidebars (for pin and bushing lubrication).
- Between roller and sidebar (for lubrication of roller and bushing).

Figure 4

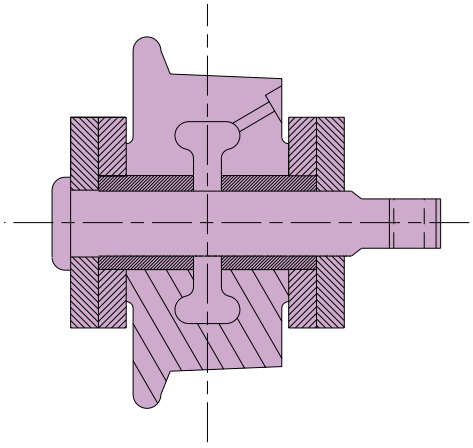


Factors to Consider when Lubricating Roller Conveyor Chain

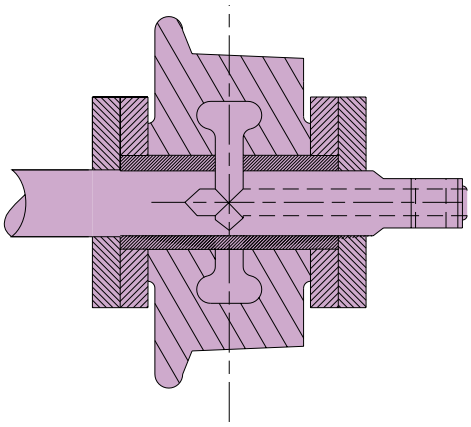
For large diameter rollers or outboard rollers lubricate by self-lubricating sintered metal bushings or by pressure through a grease fitting. Lubrication through pin heads or through rods is suggested only for chains with more than 3/4" pin or rod diameter. When this method is used on through rods, lock collars are provided in place of cotter pins. In severe applications rollers may be equipped with anti-friction bearings that have grease fittings or removable caps for grease packing.

Lubrication with grease requires pressure fittings to port the grease through chain joints. The following examples are methods of porting grease lubrication (Figure 5).

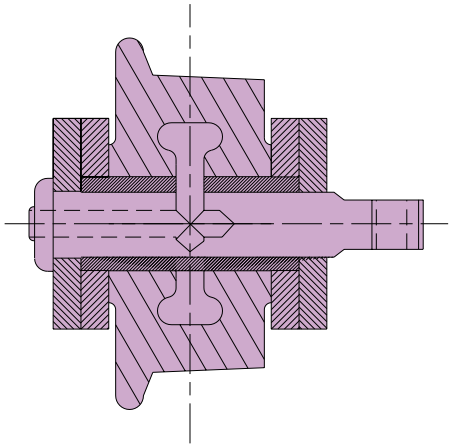
Figure 5



Lubrication through Roller

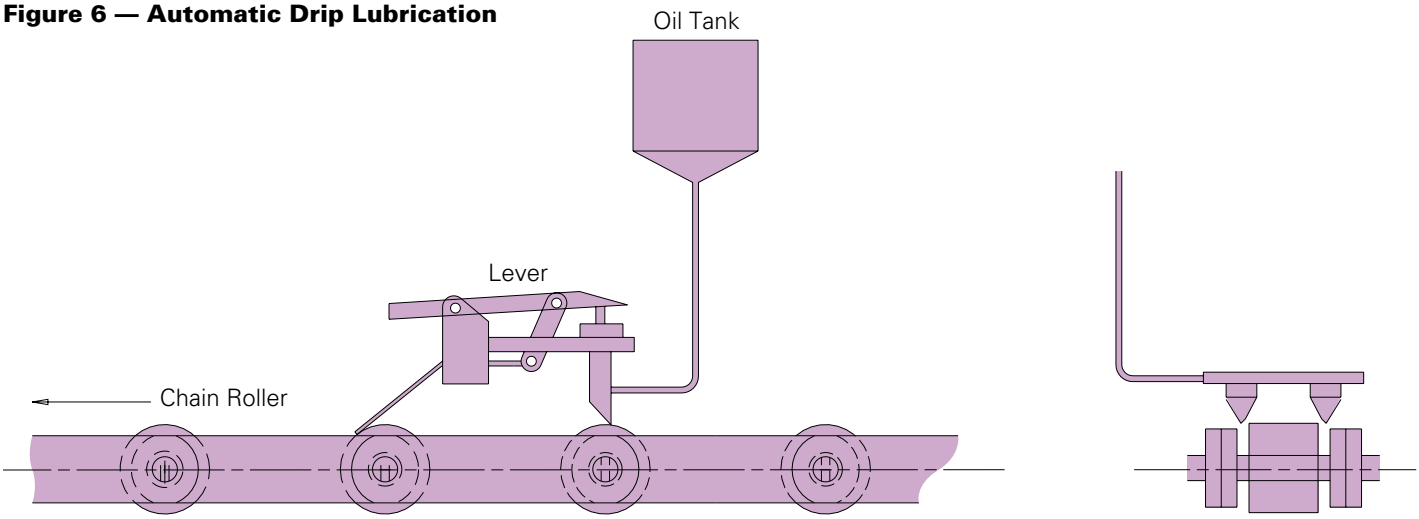


Lubrication through Pin End or Through Rod



Lubrication through Pin Head

Figure 6 — Automatic Drip Lubrication



Automatic Lubrication

Use automatic lubrication to save labor or when manual lubrication is not possible due to the location of the chain.

The automatic drip system shown in Figure 6 utilizes the chain roller as a cam. The roller pushes a pump as it passes by and causes the oil to drip.

Use a mist-type lubricator when the conveyor chain is used as an overhead trolley conveyor or when the chain requires many points to be lubricated.

For coil conveyor chain, an automatic grease feeder is suggested.

Lubrication is ineffective for bulk conveyors that convey powdery and granular materials. It will not work for flow or trough conveyors where the chain buries itself in the material as it moves and dust or other particles become embedded in the chain clearances.

Inspection

Lubrication

- Manual: Carefully follow lubrication schedule.

- Inspect apron and pan bead openings. If the beads have been wedged apart or otherwise distorted, fine material may bleed into moving parts and cause excessive wear.

⚠ WARNING

USE CARE TO PREVENT INJURY
COMPLY WITH THE FOLLOWING
TO AVOID SERIOUS PERSONAL INJURY

1. Guards must be provided on all chain and sprocket installations in accordance with provisions of ANSI/ASME B15.1 – 1996 “Safety Standards for Mechanical Power Transmission Apparatus,” and ANSI/ASME B20.1 – 1996 “Safety Standards for Conveyors and Related Equipment,” or other applicable safety standards. When revisions of these standards are published, the updated edition shall apply.

2. Always lock out power switch before installing, removing, lubricating or servicing a chain system.

3. When connecting or disconnecting chain:
   a. Eye protection is required. Wear safety glasses, protective clothing, gloves and safety shoes.
   b. Support the chain to prevent uncontrolled movement of chain and parts.
   c. Use of pressing equipment is recommended. Tools must be in good condition and properly used.
   d. Determine correct direction for pin/rivet removal or insertion.

DRAWING NO.	DESCRIPTION	NAME
1347-50130	Roller Conveyor at Block Oven Exit R1 - P and ID	25457-4480-V1A-MXA0-0043
1347-50140	Roller Conveyor for Block and Bar Assembly R2 - P and ID	25457-4480-V1A-MXA0-0044
1347-50150	Prestressing and Sealing Station Conveyor A and Platforms R4A - 1 of 2 - P and ID	25457-4480-V1A-MXA0-0045
1347-50151	Prestressing and Sealing Station Conveyor A and Platforms R4A - 2 of 2 - P and ID	25457-4480-V1A-MXA0-0046
1347-50160	Prestressing and Sealing Station Conveyor B and Platforms R4B - 1 of 2 - P and ID	25457-4480-V1A-MXA0-0047
1347-50161	Prestressing and Sealing Station Conveyor B and Platforms R4B - 2 of 2 - P and ID	25457-4480-V1A-MXA0-0048
1347-50170	Roller Conveyor After Sealing Station R3 - P and ID	25457-4480-V1A-MXA0-0049
1347-50180	Roller Conveyor at Cooling and Turning Station R5 - P and ID	25457-4480-V1A-MXA0-0050
1347-50190	Cooling and Turning Station T1 - P and ID	25457-4480-V1A-MXA0-0051
1347-50200	Chain Conveyor for Sealed Cathode C4 - P and ID	25457-4480-V1A-MXA0-0052
1347-50220	Ladle Pre-Heating Station F3A - P and ID	25457-4480-V1A-MXA0-0386
1347-50221	Ladle Pre-Heating Station F3B - P and ID	25457-4480-V1A-MXA0-0406
1347-50230	Cast Iron Ingot Drying Station A - F4A - P and ID	25457-4480-V1A-MXA0-0387
1347-50240	Cast Iron Ingot Drying Station B - F4B - P and ID	25457-4480-V1A-MXA0-0400
1347-50250	Chain Conveyor C2 and Roller Conveyor R9 - Cable Block Diagram	25457-4480-V1A-MXA0-0130
1347-50260	Cathode Bar Shotblasting Machine S1 - 1 of 2 - Cable Block Diagram	25457-4480-V1A-MXA0-0131
1347-50261	Cathode Bar Shotblasting Machine S1 - 2 of 2 - Cable Block Diagram	25457-4480-V1A-MXA0-0132
1347-50262	Dust collector for Shotblasting Machine D1 - Cable Block Diagram	25457-4480-V1A-MXA0-0133
1347-50270	Conical Roller Conveyor R8, Chain Conveyor C3 and Roller Conveyor R7 - Cable Block Diagram	25457-4480-V1A-MXA0-0134
1347-50280	Cathode Bar Heating Furnace F2 - 1 of 3 - Cable Block Diagram	25457-4480-V1A-MXA0-0135
1347-50281	Cathode Bar Heating Furnace F2 - 2 of 3- Cable Block Diagram	25457-4480-V1A-MXA0-0136
1347-50282	Cathode Bar Heating Furnace F2 - 3 of 3- Cable Block Diagram	25457-4480-V1A-MXA0-0137
1347-50290	Roller Conveyor at Bar Furnace Exit R6 - Cable Block Diagram	25457-4480-V1A-MXA0-0138
1347-50300	Positioning Gantry for Block and Bars G1 - Cable Block Diagram	25457-4480-V1A-MXA0-0139
1347-50310	Chain Conveyor of Block Oven C1 and Cathode Block Oven F1 - 1 of 2 - Cable Block Diagram	25457-4480-V1A-MXA0-0140
1347-50311	Cathode Block Oven F1 -2 of 2 - Cable Block Diagram	25457-4480-V1A-MXA0-0141
1347-50320	Roller Conveyor at Block Oven Exit R1 - Cable Block Diagram	25457-4480-V1A-MXA0-0142
1347-50330	Roller Conveyor for Block and Bar Assembly R2 - Cable Block Diagram	25457-4480-V1A-MXA0-0143
1347-50340	Prestressing and Sealing Station Conveyor at R4A - Cable Block Diagram	25457-4480-V1A-MXA0-0144

DRAWING NO.	DESCRIPTION	NAME
1347-50350	Prestressing and Sealing Station Conveyor B R4B - Cable Block Diagram	25457-4480-V1A-MXA0-0145
1347-50360	Cooling and Turning Station T1 and Roller conveyor R3 and R5 - Cable Block Diagram	25457-4480-V1A-MXA0-0146
1347-50370	Chain Conveyor for Sealed Cathode C4 - Cable Block Diagram	25457-4480-V1A-MXA0-0147

1347-R4-1513	Platforms - Platform No 4 - Right	25457-4480-V1A-MXA0-0170
1347-R4-1514	Platforms - Stair No 1 - Right	25457-4480-V1A-MXA0-0171
1347-R4-1515	Platforms - Handrail No 1 - Right	25457-4480-V1A-MXA0-0172
1347-R4-1516	Platforms - Handrail No 2 - Right	25457-4480-V1A-MXA0-0173
1347-R4-1517	Platforms - Handrail No 3 - Right	25457-4480-V1A-MXA0-0174
1347-R5-1000	Roller Conveyor at Cooling and Turning Station General Arrangement	25457-4480-V1A-MXA0-0114
1347-R6-1000	Roller Conveyor at Bar Furnace Exit - General Arrangement	25457-4480-V1A-MXA0-0018
1347-R7-1000	Roller Conveyor at Bar Furnace Exit General Arrangement	25457-4480-V1A-MXA0-0021

1347-R8-1000	Conical Roller Conveyor at Shot Blasting Machine Exit General Arrangement	25457-4480-V1A-MXA0-0022
1347-R9-1000	Conical Roller Conveyor at Shot Blasting Machine Entrance General Arrangement	25457-4480-V1A-MXA0-0028
1347-T1-1000	Cooling Turning Station General Arrangement	25457-4480-V1A-MXA0-0116
1347-S1-1000	Cathode Bar Shot Blasting Machine & Dust Collector General Arrangement	25457-4480-V1A-MXA0-0129

9.3 Foundation and Loads Drawings

DRAWING No.	DESCRIPTION	NAME
1347-AR-0100	Cathode Sealing Equipment - Foundation and Load - 1 of 2	25457-4480-V1A-MXA0-0059
1347-AR-0101	Cathode Sealing Equipment - Foundation and Load - 2 of 2	25457-4480-V1A-MXA0-0060

9.4 Hydraulic Drawings

DRAWING No.	DESCRIPTION	NAME
1347-AR-3000	Cathode Sealing Equipment Hydraulic Piping Routing	25457-4480-V1A-MXA0-0404
1347-H1-3001	Hydraulic System Schematic	25457-4480-V1A-MXA0-0156
1347-H1-3002	Hydraulic System Schematic	25457-4480-V1A-MXA0-0157
1347-H1-3003	Hydraulic System Schematic	25457-4480-V1A-MXA0-0158
1347-H1-3004	Hydraulic System Schematic	25457-4480-V1A-MXA0-0159
1347-H1-3005	Bill of Material - Hydraulic	25457-4480-V1A-MXA0-0160

9.5 Pneumatic Drawings

DRAWING No.	DESCRIPTION	NAME
1347-AR-4000	Cathode Sealing Equipment Pneumatic Piping Routing	25457-4480-V1A-MXA0-0405

9.6 Cable Block Diagrams

DRAWING No.	DESCRIPTION	NAME
1347-50250	Chain Conveyor C2 and Roller Conveyor R9 - Cable Block Diagram	25457-4480-V1A-MXA0-0130
1347-50260	Cathode Bar Shotblasting Machine S1 - 1 of 2 - Cable Block Diagram	25457-4480-V1A-MXA0-0131
1347-50261	Cathode Bar Shotblasting Machine S1 - 2 of 2 - Cable Block Diagram	25457-4480-V1A-MXA0-0132
1347-50262	Dust collector for Shotblasting Machine D1 - Cable Block Diagram	25457-4480-V1A-MXA0-0133
1347-50270	Conical Roller Conveyor R8, Chain Conveyor C3 and Roller Conveyor R7 - Cable Block Diagram	25457-4480-V1A-MXA0-0134
1347-50280	Cathode Bar Heating Furnace F2 - 1 of 3 - Cable Block Diagram	25457-4480-V1A-MXA0-0135
1347-50281	Cathode Bar Heating Furnace F2 - 2 of 3- Cable Block Diagram	25457-4480-V1A-MXA0-0136
1347-50282	Cathode Bar Heating Furnace F2 - 3 of 3- Cable Block Diagram	25457-4480-V1A-MXA0-0137
1347-50290	Roller Conveyor at Bar Furnace Exit R6 - Cable Block Diagram	25457-4480-V1A-MXA0-0138
1347-50300	Positioning Gantry for Block and Bars G1 - Cable Block Diagram	25457-4480-V1A-MXA0-0139
1347-50310	Chain Conveyor of Block Oven C1 and Cathode Block Oven F1 - 1 of 2 - Cable Block Diagram	25457-4480-V1A-MXA0-0140
1347-50311	Cathode Block Oven F1 -2 of 2 - Cable Block Diagram	25457-4480-V1A-MXA0-0141
1347-50320	Roller Conveyor at Block Oven Exit R1 - Cable Block Diagram	25457-4480-V1A-MXA0-0142
1347-50330	Roller Conveyor for Block and Bar Assembly R2 - Cable Block Diagram	25457-4480-V1A-MXA0-0143
1347-50340	Prestressing and Sealing Station Conveyor at R4A - Cable Block Diagram	25457-4480-V1A-MXA0-0144
1347-50350	Prestressing and Sealing Station Conveyor B R4B - Cable Block Diagram	25457-4480-V1A-MXA0-0145
1347-50360	Cooling and Turning Station T1 and Roller conveyor R3 and R5 - Cable Block Diagram	25457-4480-V1A-MXA0-0146
1347-50370	Chain Conveyor for Sealed Cathode C4 - Cable Block Diagram	25457-4480-V1A-MXA0-0147
1347-50380	Hydraulic Power Unit H1 - Cable Block Diagram	25457-4480-V1A-MXA0-0148
1347-50390	Chiller for Hydraulic Power Unit W1 - Cable Block Diagram	25457-4480-V1A-MXA0-0149
1347-50400	Ladle Pre-Heating Station F3A - Cable Block Diagram	25457-4480-V1A-MXA0-0150
1347-50410	Cast Iron Ingot Drying Station F4 A- Cable Block Diagram	25457-4480-V1A-MXA0-0151
1347-50420	Cast Iron Ingot Drying Station F4B - Cable Block Diagram	25457-4480-V1A-MXA0-0152
1347-50430	Ladle Pre-Heating Station F3B - Cable Block Diagram	25457-4480-V1A-MXA0-0407

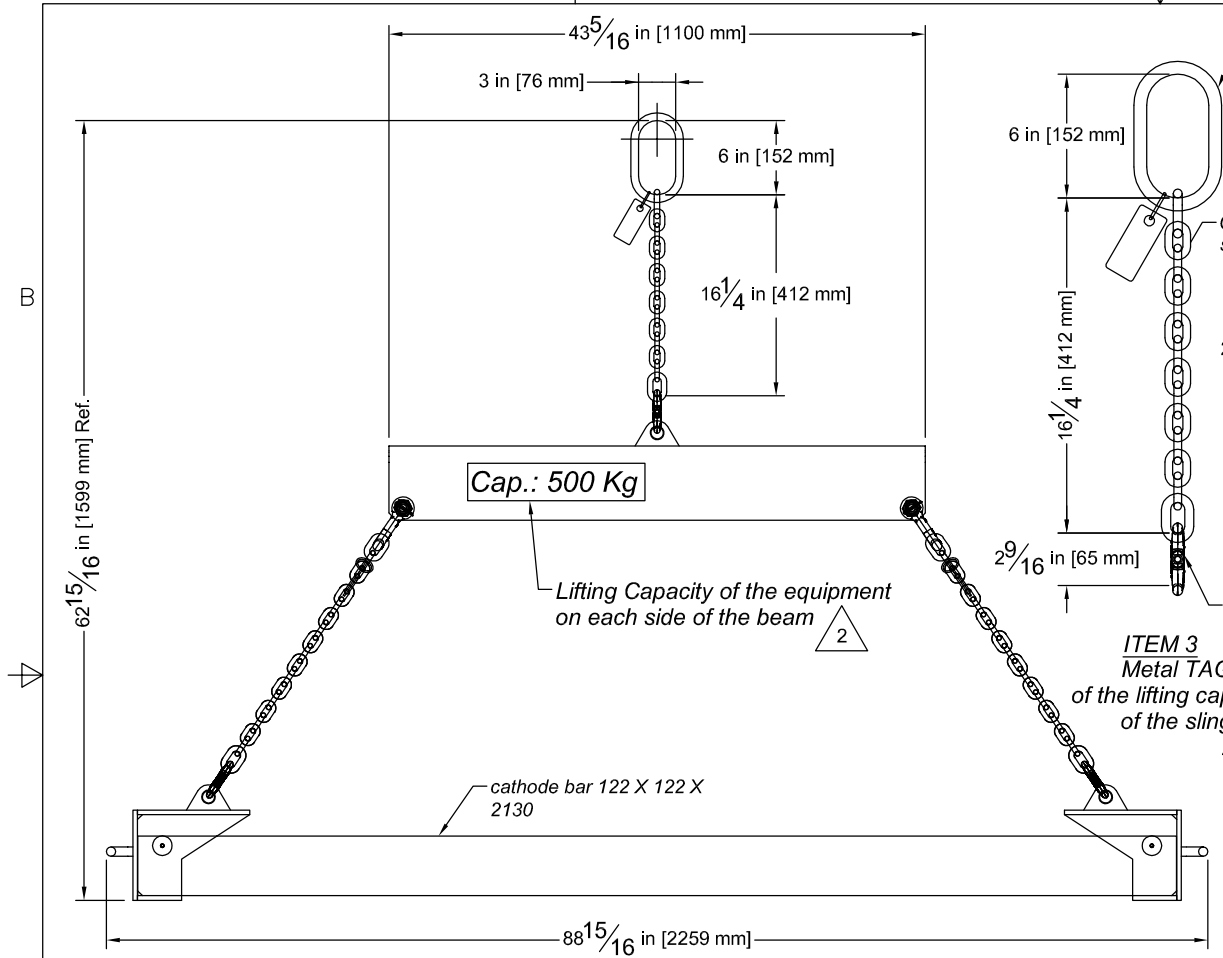
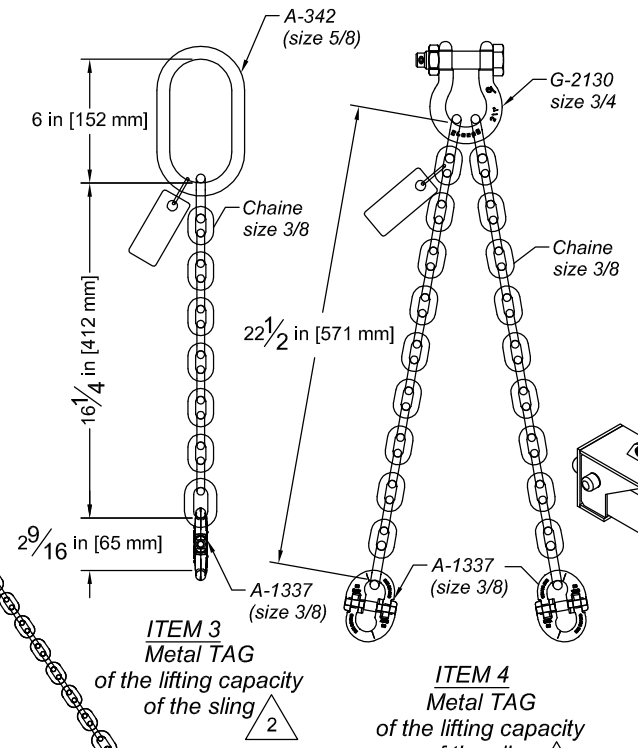
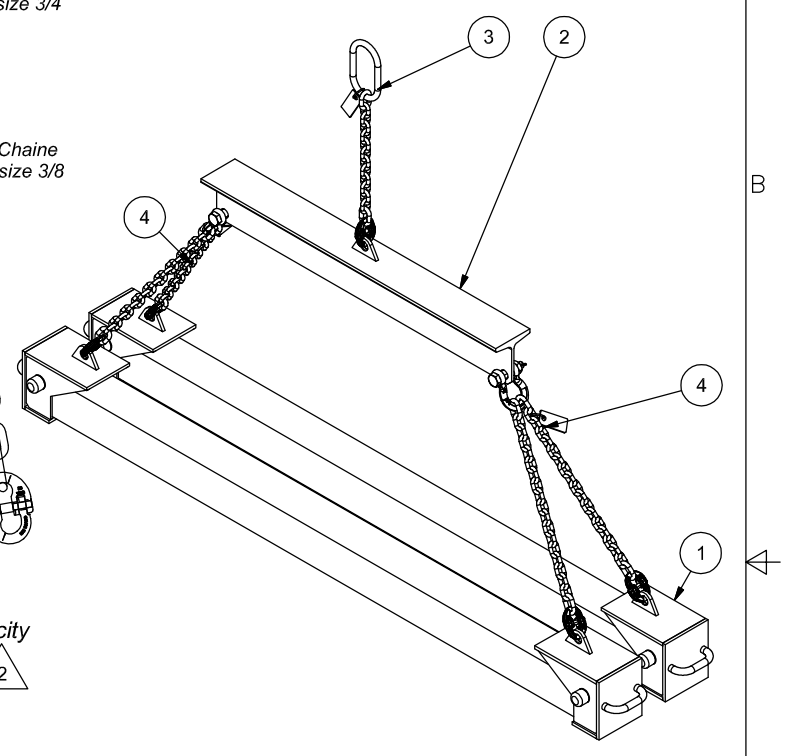
REVISION HISTORY

REV	DESCRIPTION	DATE	APPROVED
1	Revision by the customer's request	16/11/2010	
2	Revision as client notes	02/12/2010	







NOTES:
1. BREAK SHARP CORNERS, DEBURR AFTER DRILLING AND CUTTING.
2. ALL STRUCTURAL SHAPES AND PLATES MUST BE WITHOUT DISTORTION.
3. ALL WELDS MUST CONFORM CSA W-47, W-59.
4. STEEL PLATES SHALL BE CUT OUT OF ONE PLATE ONLY,IF NOT, JOINING PLATES SHALL BE WELDED BUTT JOINT FULL PENETRATION. THE WELDING SEAM SHALL BE BEHIND A STRUCTURAL SHAPE.
   IF NOT OTHERWISE SPECIFIED, ALL WELDS ARE CONTINUOUS.
5. CLEAN ALL WELDED SURFACES OF BURRS AND ASPERITIES.
6. HANDLE PAINTED WITH CARE (TO AVOID RUST AFTER INSTALLATION).
7. PROVIDE AND INSTALL LIFTING LUG(S) APPROPRIATE FOR TOTAL WEIGHT OF PART(S) (IF APPLICABLE).
8. PRE-ASSEMBLE PARTS IN SHOP FOR DIMENSIONAL AND FUNCTIONAL VERIFICATION.
9. ALL MACHINED SURFACES TO BE COATED WITH TEMPORARY CORROSION PROTECTION.
10. PIECES SHALL BE MATCH MARKED FOR SUBSEQUENT DISASSEMLY.
11. LENGTHS ON BILL OF MATERIAL ARE NOMINAL DIMENSIONS, REFER TO DRAWING FOR EXACT DIMENSIONS.

PAINT NOTES:
1. PAINT PROCEDURE AND MANUFACTURER AS PER BECHTEL SPECIFICATION 25457-0000-3PS-G000-0002 REV.001

LADLE CAPACITY = 840#(380KG) IRON BASED ON .23# PER CUBIC INCH DENSITY, 2 1/2" SIDE LINING 2 1/2" BOTTOM LINING AND 3 1/2" FREE TOP SPACE.
ALL REFRACTORY IS SUPPLIED AND INSTALLED BY OTHERS.
REFRACTORY DENSITY OF .09# PER CUBIC INCH USED FOR BALANCE CALCULATIONS.
NOTE: THE RATED CAPACITY OF THIS LADLE IS BASED ON THE VOLUME OF THE LADLE, LINING THICKNESS AND INDICATED NOMINAL FREE TOP SPACE.
CAUTION: LADLE FILL LEVEL MUST COMPLY WITH ANSI SPEC. Z 241.2 SECTION 6.3.5.1 "LADLES SHALL NOT BE FILLED WITH MOLTEN MATERIAL ABOVE A LEVEL WHERE SPILLAGE MAY OCCUR WHEN NORMALLY TRANSPORTED".

MATERIAL SPECIFICATION NOTES

1) ALL STEEL SHALL CONFORM TO ASTM A36 STANDARDS FOR MINIMUM MECHANICAL PROPERTIES, AND SHALL BE FABRICATED IN ACCORDANCE WITH THE RECOMMENDED PRACTICE OF THE AMERICAN INSTITUTE OF STEEL CONSTRUCTION.
2) ALL STEEL SHALL CONFORM TO ANSI/ASTM A6-78 (OR LATEST EDITION) STANDARDS FOR DIMENSIONAL TOLERANCE.
3) ALL BOLTS SHALL CONFORM TO ASTM A325 STANDARDS FOR MINIMUM MECHANICAL PROPERTIES UNLESS OTHERWISE SPECIFIED.
4) WELDING PROCEDURES TO CONFORM TO AISC FOR DESIGN, FABRICATION AND ERECTION OF STRUCTURAL STEEL FOR BUILDINGS.
5) AISC STANDARD WELDING SYMBOLS WILL BE USED FOR THE DESIGNATION OF WELDS.
6) ALL SHOP AND FIELD WELDED CONNECTIONS SHALL BE MADE WITH E70 SERIES ELECTRODES UNLESS OTHERWISE SPECIFIED.

NOTES:
1. BREAK SHARP CORNERS, DEBURR AFTER DRILLING AND CUTTING.
2. ALL STRUCTURAL SHAPES AND PLATES MUST BE WITHOUT DISTORTION.
3. ALL WELDS MUST CONFORM CSA W-47, W-59.
4. STEEL PLATES SHALL BE CUT OUT OF ONE PLATE ONLY, IF NOT, JOINING PLATES SHALL BE WELDED BUTT JOINT FULL PENETRATION. THE WELDING SEAM SHALL BE BEHIND A STRUCTURAL SHAPE.
   IF NOT OTHERWISE SPECIFIED, ALL WELDS ARE CONTINUOUS.
5. CLEAN ALL WELDED SURFACES OF BURRS AND ASPERITIES.
6. HANDLE PAINTED PIECES WITH CARE (TO AVOID RUST AFTER INSTALLATION)
7. PROVIDE AND INSTALL LIFTING LUG(S) APPROPRIATE FOR TOTAL WEIGHT OF PART(S). (IF APPLICABLE)
8. PRE-ASSEMBLE PARTS IN SHOP FOR DIMENSIONAL AND FUNCTIONAL VERIFICATION.
9. ALL MACHINED SURFACES TO BE COATED WITH TEMPORARY CORROSION PROTECTION.
10. PIECES SHALL BE MATCH MARKED FOR SUBSEQUENT DISASSEMBLY.
11. LENGTHS ON BILL OF MATERIAL ARE NOMINAL DIMENSIONS, REFER TO DRAWING FOR EXACT DIMENSIONS.

A-A

NOTES:

1. BREAK SHARP CORNERS, DEBURR AFTER DRILLING AND CUTTING.
2. ALL STRUCTURAL SHAPES AND PLATES MUST BE WITHOUT DISTORTION.
3. ALL WELDS MUST CONFORM CSA W-47, W-59.
4. STEEL PLATES SHALL BE CUT OUT OF ONE PLATE ONLY, IF NOT, JOINING PLATES SHALL BE WELDED BUTT JOINT FULL PENETRATION. THE WELDING SEAM SHALL BE BEHIND A STRUCTURAL SHAPE.
   IF NOT OTHERWISE SPECIFIED, ALL WELDS ARE CONTINUOUS.
5. CLEAN ALL WELDED SURFACES OF BURRS AND ASPERITIES.
6. HANDLE PAINTED PIECES WITH CARE (TO AVOID RUST AFTER INSTALLATION)
7. PROVIDE AND INSTALL LIFTING LUG(S) APPROPRIATE FOR TOTAL WEIGHT OF PART(S). (IF APPLICABLE)
8. PRE-ASSEMBLE PARTS IN SHOP FOR DIMENSIONAL AND FUNCTIONAL VERIFICATION.
9. ALL MACHINED SURFACES TO BE COATED WITH TEMPORARY CORROSION PROTECTION.
10. PIECES SHALL BE MATCH MARKED FOR SUBSEQUENT DISASSEMBLY.
11. LENGTHS ON BILL OF MATERIAL ARE NOMINAL DIMENSIONS, REFER TO DRAWING FOR EXACT DIMENSIONS.

PAINT NOTES:

PLC PANEL 4481-CP-1000 TO BE CONNECTED TO EARTH BAR WITH 35 SQ MM CABLES.
2-CONTROL PANELS 4481-MHCD-0003-CP-01, 4481-MQLK-0001-CP-01, 4481-CP-1001, 4481-MPF0-0001-CP-01, 4481-MBAD-0001-CP-01, 4481-MEVD-0001-CP-01, 4481-MEVD-0002-CP-01 AND 4481-MEHX-0001-CP-01, LOCAL CONTROL STATIONS AND JUNCTION BOX TO BE CONNECTED TO EARTH BAR WITH 16 SQ MM CABLES.
3-THE OTHERS JUNCTION BOXES (HEATING ELEMENTS) , TO BE CONNECTED TO EARTH BAR WITH 35 SQ MM CABLES.
4-ALL LOCAL DISCONNECT SWITCHES MUST BE CONNECTED TO EARTH BAR WITH 35 SQ MM CABLES.
5-ALL MOTORS MUST BE CONNECTED TO EARTH BAR WITH 35 SQ MM CABLES.
6-FOR EQUIPEMENT EARTHING REFER TO DRAWINGS 25457-40AZ-EG-4481-0001-000 AND 25457-40AZ-EG-4481-0002-000.
